the problem is the coupling of the tuner to your antenna system, the dummy load has no reactive components. second most of the " power meters" are nothing more than a diode detector that needs to be calibrated to an accurate reference (like a delta or coaxial dynamics wattmeter) ..... you need to measure the peak to peak voltage with a scope across the 50 ohm dummy load the divide that number by 2, then times it by .707, then square that number and divide by 50......that is your RMS power.

2. TS-850S problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-01 00:00:00 UTC
From: Clark Thompson <cmthomp1@facstaff.wisc.edu>
Message-ID: <34326652.2F73@facstaff.wisc.edu>
Source record: 164811

Hi,

I have a six-year-old Kenwood TS-850S (30 Million S/N) that I'm having problems with. The Up/Down band switch and, more recently, the Mem. In and Scan keys are intermittant. I also have problems with the VFO/Mem. Ch. encoder slipping or skipping(the encoder was replaced under warranty for the same problem about 5 years ago). I have tried numerous times to fix the problem with contact cleaners (most recently with DeOxit D-5). Operation returns to normal for a few days or weeks but the problem always comes back. It's worse when I haven't used the rig for a while. I've thought about disasembling the whole front panel to be better able to clean the contacts but I thought I should seek advice first. Is this a common problem? Otherwise the rig works great.

Thanks & 73,

Clark, KD9QI

markrobt+usenet@tezcat.com (Mark Roberts) wrote:

WWV and WWVH broadcast a 100 Hz time code. This is an
IRIG-H code with a 1 minute repeat cycle. Information is
encoded in BCD (Binary Coded Decimal); information similar
to that carried by WWVB. Get an old SW radio with a 10 inch
speaker and you can hear the 100 Hz code quite easily. This
code has been transmitted since at least the early 1970's.

>It comes with a small external ferrite-bar antenna connected
>to the clock by a wire. That antenna definitely
>is needed.

The ferrite bar would make more sense at 60 kHz than on SW
frequencies. A SW receiver would typically use a whip
antenna.

Pierre Thomson <pthomson@bruderhof.com> wrote:

To lay this question to rest: the R.S. clock receives WWVB on 60 KHz.

If you have trouble receiving the signal, take heart: NIST is in
the process of increasing their transmitter power and modifying
the antenna system to better cover the 48 states. There should
be a substantial increase in coverage of the East and West coasts
sometime in December. You might want to buy a clock at the sale
price, because the sale will probably end then! See:

http://www.bldrdoc.gov/timefreq/wwvstatus.htm

Good luck,

Pierre Thomson KA2QPG

The attorney who taught the college Business Law courses I took said
that a check is "Demand Paper", payable on demand and the date on it has
no effect at all on that fact. Of course, the bank you present it to may
have their own policy in regard to this situation, though.

>police use their HT's in their cars.

Any of the generic brackets for holding a handheld cellphone can
be adapted to holding a HT. Most are spring loaded for easy in
and out. Do be aware that using a headset (even the one ear type)
may be illegal in your state (it is in Georgia).

>I realize that an external antenna on the car is best..... but for now
>I would use the 50r stock duckie. Actually... this "ideal" bracket
>would have a connector for an external antenna.

Unfortunately, the radio doesn't have the side wiper contacts that
GE HTs used by police have, so you have to hassle with the connectors
on the radio to hook up external power, antenna, and speaker/mic.
This cable tangle will prevent a clean installation, and will quickly
wear out the connectors on the radio, which weren't designed to
tolerate this sort of continual plugging and unplugging.

>Any ideas or advice on the above... anyone?

Pay attention to what the others have said about using an external
antenna. Using the rubber dummy load inside the car will give you
very disappointing performance. And pay particular attention to
what the fellow said about being noisy/marginal into repeaters that
you can hear fine. The repeater is designed to be balanced, IE to
hear a station as far as the repeater can be heard. But that is only
true if the station is roughly *equivalent* to the repeater. Since
the repeater runs 50-150 watts, and you are running 2-5 watts,
that isn't going to happen.

On many repeaters that you can hear fine, you are going to be *very*
painful for others to copy. Be considerate and either add an amplifier,
or desist from using repeaters where you are marginal. Nothing can
spoil a roundtable faster than someone on a Handi-Scratchie in the car.

This is one of the reasons I recomend that people don't purchase a
HT as the first or only rig. Other reasons are that the HT is likely to
suffer much more from intermod than a good moble rig, and because

it is likely to have too little audio for comfortable listening in a moving vehicle (the FT50R does have good audio output for a HT though, and if headset use is legal in your state, that helps too). By the time you add kludges to make the HT double satisfactorily as a mobile rig, you'll have likely spent more than the cost of a mobile rig, and the install will still be a rat's nest.

If a HT is all you have, then you have to make the best of it, but a HT is really a specialist tool for foot mobile operation, not a substitute for a proper mobile rig.

I have a heap of command radios, parts, documentation, etc. that
I need to move out. Here is listing with as detailed a description
as I can provide. If someone is interested in the whole batch, it
would be nice for them to come pick it up in the Portland, OR area.
I will consider shipping it, but there's alot of stuff. I'm asking
$175 OBO + shipping for the whole bunch, but I'll consider any
reasonable offer. I'm selling this for a friend who is overseas and
I need to move it out of my basement!!

I am considering the purchase of an SGC 230 auto tuner for use on a boat. Any comments from current users? The 230 I am looking at is new, but not the latest model. The seller says the smart lock feature can be added for $15. What does this feature do? The SGC 230 is around $400. Is this a good deal? Should I buy a later model? Do they work well with a 23 foot antenna on a wildly pitching boat? Thanks very much for any info.

> members
> with some device.

I've got to sympathize with you too on your interference problem. I've been in community theatre myself for many years, and tracking down sound system problems is frequently a pain in the neck.

You say the problem only occurs during performances? Are you using the stage lighting system (i.e., big triac dimmers that cause RFI hash) at any other time besides performances? When using the lighting system, do you routinely have cues that have the dimmers at half power (i.e., the highest amplitude and harmonic-content switch-on edge possible on the AC power feeding the lights)? Is it during those cues that the interference is the worst? Even if you have an old-style variac or resistor light board (let's hope not!), contact wear in variac or resistor dimmers could cause arcing and therefore RFI. For that matter, do you run microphone cables bundled with stagelight power cables (to force the cables feeding sensitive pre-amps to be close to sources of raging RFI)? This sort of interference source is likely if the problem occurs at the same cues in the performance every time (i.e., when you power up the lighting circuits providing the RFI source).

It may be that you yourself are the interference source. :-(

You didn't say if the interference was pretty much the same for every performance, or only _some_ performances. You also didn't describe your performance space (at least not in the replies I saw; I came in on this late). Is there heavy electrical machinery elsewhere in the building that might be running during your performances (and generating RFI)?

Is it a humming type noise instead of a grating harmonic or "spark-gap" hash noise? That would sound like a grounding / ground-loop problem. If that is the case, you'll have to track down where the ground loop is and break it.

Now, if the problem is obvious jamming of some wireless microphones (i.e., a true signal is being picked up in your receivers in place of the transmissions from the body mikes, instead of just black noise), then you need to look at the content of the other signal. Is your theatre located right next to a commercial radio station or police or fire dispatch transmitter? Your receivers could be suffering from brute-force, image, or audio rectification interference from such sources. For the first two, the only reasonable solution (since you're obviously not going to redesign your microphone receivers) is to improve the signal-to-noise ratio by getting the receivers located closer to where your transmitters are (so the body mike signal has a better chance by inverse-square-law to drown out the interference). For brute-force interference, you might actually try _reducing_ the sensitivity of the receivers

so the interference isn't as strong when it reaches the electronics; this can be done by not running telescopic antennas out to full length. Solving audio rectification is a black art in its own right (many different techniques are applicable; check a good ham radio reference book like the ARRL Handbook [can you get that in Oz?]), but the solutions for brute force interference will provide a partial solution for audio rectification as well.

I'd look at the appropriate subset of these sources before I did something as Big-Brother-ish as comparing the names on the ticket reservation lists against the nights that interference occurred. Even if some jerk _is_ bringing a wide-band spark-gap type jamming device into the house, the same practices that would protect you against interference from yourself would reduce your vulnerability to jamming. Narrow-band jamming, on the other hand, can only be stopped by the methods described above for true jamming, or by taking out the jamming transmitter. Having your ushers carry radio direction finding gear around might be a little awkward, if you can confirm that this problem really is a malicious audience member. :-)

Hope this helps. Break a leg!

To see the firmware rev, hold down the AR key while powering up.
It'll come up with a display test. Press AR repeatedly until the software
rev comes up on the display (8 presses on mine). Power off and back
on to return to normal operation.

Jack-

It shouldn't sound like static. However, there are other things that might cause that, so don't replace the microphone without checking. It could also be something like a loose microphone cable connection or a bad antenna or antenna cable.

Some rigs have a microphone gain control, so it is possible to get far away from the microphone and still modulate the rig. But, that isn't the way it is supposed to work. A Ham rig is NOT a broadcast station. It is meant to be used in a relatively noisey environment, as opposed to being used in a soundproofed studio booth.

For best signal-to-noise ratio, you should speak in a normal voice close to the microphone, about a half inch away. If that is what you mean by "swallow the mic", then that is the way it should work. On the other hand, if you really have to stick it in your mouth and yell, then something is obviously wrong.

I don't think the desktop charger will put out enough amperage for transmit. For this application I would suggest an external power supply. 2amps or so is all you should need.

Plus I'm not sure what you might do to NiCd batteries using them in this constantly charged mode. I understand that memory concept may be overrated but this sounds like one of the cases where it would matter.

For $20 you can get the clip on mic/speaker which clips very nicely on the shoulder belt of your seat belt. Fidelity is slightly lower be very acceptable and much more comfortable that hanging the HT on your chest. The only downside is that the controls are not at your chest. So if this is important to you, that could be an issue.

Are you looking to buy a radio for just VHF / UHF FM work or something more like DXing and meteors etc... ?

I would say the best VHF/UHF radio is the Yaesu FT-736R.

Craig

23. Opinions needed for new HF rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-01 00:00:00 UTC
From: dxer@aol.com
Message-ID: <19971001222000.SAA13220@ladder02.news.aol.com>
Source record: 164832

After being out of ham radio for several years I am looking into buying a new radio. So far I have only looked at an HRO catalog and a CQ. I havent read any reviews. The last radio I owned was a Kenwood TS-850 and liked it very much. Though it seemed to have a problem with some of the buttons that did the split settings stick. From the radios I have looked at the ones that I am most interested in at this time are the Icom 775 DSP...Yaesu FT-1000D and the Kenwoods TS-870 and the TS-950.
Isnt the 1000D rather older technology, and it doesnt have DSP built in ?
How does the DSP work in the 870 as compared to the 950 ? And I have never owned an Icom before.
I am very interested in all opinions from what is heard on the air to reviews to actually using the radios, either your own or a friends.

Thank You
Craig

Well, it's official, both kenwood 3530's must go. asking $175/uship for the pair. Price has been lowered upon inspection, as one radio will need some work. BOTH RADIOS FUNCTION PROPERLY. info:
-excellent radio: first one has all buttons/lamps intact, with some case scratches, and normal mobile wear for a rig of it's age. factory mic, only oddball is someone added taller rubber feet. power cord cut rather short. good radio with a little cleanup.
-needs work: this one has been through the wringer on appearance, as the case has been painted black (decent paintjob..), has 3,4 dings, lcd lamps burnt out, needs power cord grommet, has wrong tuning knob and is missing the f.lock key altogether, and has some sloppy repair to bottom board, BUT it works really well and might make good repeater stock. no ctcss on either unit as far as I can tell. email if interested, as this seems to me to be a good deal on a couple good radios. thanks for your time,
Randy

Try momentarily pressing and releasing the Function key, then press the lamp button. This should turn it off. The lamp button should then work normally (the lamp shuts off after a few seconds). To lock the light on, press and release the Function button, then press lamp. I think this is in the manual but not having owned a 530 for about two years, I can't say for sure.

Hello,
I recently purchased a used Kenwood TR-9130 2meter all mode. It didn't have a manual. If someone knows a source for the manual or has one they would be willing to copy and send me I'd appreciate it. I emailed Kenwood, they don't have any and the parts vendor they refered me do don't have any either.

Thanks,
Roger Sellers KB9LBU

Thanks to all who replied. Looks like there is only one FCC approved
model out there - the Yaesu FT-2070 (also marketed as the Vertex
FTH-2070).

So, I pose a second question... could anyone give me a brief review of
this radio... performance, pros/cons, etc??

I appreciate everyone's helpful input!

Source record: 164843

Hey Guys,

Hoping someone can help me out with some info. I am interested in getting a affordable mobile dual band 2m/440 transceiver. I need to know what everyone would suggest??? Price is a factor but not for the sake of just saving money. I am studying for my test now and want to be prepared when the time comes. I have been listening on my scanner for a while and find plenty to listen to on the 2m band. But I have yet to hear anybody on the 440 band. Is it not as popular??? I find no repeater frequencies listed anywhere for my area in the 440 band.

Also if I had a antenna in my attic approx 15ft off ground and had a 50w unit in my car approx how far can i communicate from my house considering S. Floridas flat terrain??? 440 vs 2meter. 1/4 wave ground plane antenna in attic.

Personally, I put the 80 meter 10 kw amp to work as an electric water heater. Boy do those faucets whistle while I shave each morning, really steams up the mirror, too! Oh yeh, get some good pressure relief valves and some steam shields - saves wear an tear on the old lady while she's doing laundry.

There is a site in Maryland that repairs Swans. They have government contracts that pay the bills and do the Swan stuff for giggles - really, I had them do some work and the prices were amazingly cheap!
There is a 40 Meter net at lunchtime weekdays where Swan affectionados gather to talk about such things and the guy who runs the Swan piece of that shop is often on. He's a real nice guy. Forget his call.
If you absolutely cannot find them let me know and I'll try to run the info down here somewhere.
Guaranteed they will restore it for real short money - and do a nice job of it. DavidC AA1FA

Hi Jim
May I offer a suggestion.
Rather than go to the expensive and complexity of your roof mounted
vertical, have you considered a simple, but effective, random wire
antenna.

The only, real, complexity will be building a series tuned circuit
antenna coupler. I don't have a copy of the arrl handbook, my last
issue over 10 years old, accidently got tossed out, I believe had
diagrams for simple series tuned circuits. You may have to visit an
amateur fleamarket to get a suitabe variable capacitor and coil but
random wire antennas do work.

Try to get two 80m radials (66' or so) on opposite sides of each
other. Bend them as required, but not at too acute an angle. If you
can get one on the roof and one in the attic so they oppose each
other, the antenna will work reasonably well. By oppose, I mean they
would look like this _._ where the . is the antenna.

The radial in the attic: be careful. There is very high voltage at the
far end of the radial (most distant from the vertical). You don't want
to shock anyone who goes into the attic, nor set up a "spark"
situation as a result of a short that could start a fire in the attic.

You can be very creative in laying out the radials. Bends, curves, you
name it, just don't fold it back on itself.

Both Devoldre's "Low Band DX'ing" and the ARRL Antenna Book show that
as few as two elevated radials, as long as they are "opposing",
produce a very acceptable, if not ideal, counterpoise for a 1/4 wave
elevated vertical. If you can't oppose them, pattern distortion will
result.

No matter what, don't use fewer than two elevated radials per band,
even if they have to be non-opposing. In your situtation, using more
than two, is probably not worth it. (The requirement of using 3 or 4
spaced 120 or 90 degrees respectively, is treated as a myth in the
sources noted above, and the computer models are provided to back it
up....so don't dispair.)

Good luck, 73

Date: 1997-10-01 00:00:00 UTC
From: Ken Morrison <alverne@ix.netcom.com>
Message-ID: <01bcce27$5a79a820$e36a5ecf@preinstalledcom>
Source record: 164876

Glad I started this thread!

Since the original post, I bought the Yaesu DC cord, speaker mic, and a Larsen dual-band mag mount (I ordered the antenna with an SMA connector, so as to eliminate adaptors). This combination offers superior results on Tx, and the expected results on Rx - INTERMOD!!! But, if you can live with a little noise (or are lucky enough to be operating away from sources of intermod), it's not such a bad setup.

In answer to John's question about mounting it in the vehicle, I simply place it clipped inside a cheap plastic coffee cup holder (ring type), which I had attached to my dash some time ago. It looks a little "cheesey", but when I take the FT-50 with me, and remove the mag mount from the roof, there is no evidence of anything that anyone would want to steal.

Hope this info was useful to you.

Ken

It depends on your requirements ;-)
If you are going to work seriously on HF it wouldn't the better chioce.
We've checked the front-edge of ic-706, ts-50 and ft-900 (HF of course)
at the same time. The dynamic range difference is approximatly 10 db
between all of them with the monotonic increase from ic to ft. Prices...
you know them.

You might ask the bank about the "check" and what to do, I (though no lawyer) *believe* that a post dated check like that is legally not a check but instead a promissory (sp?) note and that may open up another whole can of worms

Hi Dick. I believe there is an article on Mitrek model numbers and what they
mean at <http://www.seits.org/>
As I remember some models are designed for 136-146 MHz and others are designed
for 146-174 Mhz. And somewhere I have seen a file under "mods" on some packet
bbs's that tells how to get Mitrek manuals from Motorola, they cost $20 or so.

: of my email. (I put the letters "cq" so that the automatic email SPAM
: programs will get the wrong address.) :-)
: --

: Less than a week ago I purchased an Icom IC-T2A 2M HT. Overall, I'm
: very happy with the unit, except for one problem that's really odd.

: When I transmit the Audio is muffeled and weak. One friend said, "It
: sounds like I have a bucket over my head!" I went back to HRO (where
: I purchased the unit) and guess what, 2 other units in the store sound
: exactly the same. (The sound from a Yaesu was chrisp and clear.)

: By the way, while the people at HRO couldn't solve the problem, they
: were VERY helpful and did take the time with me to try different things.

: In testing the Icom IC-T2A at home, I plugged a Radio Shack Speaker/Mike
: into the unit and re-tested the unit. With the RS Mike, the audio was
: clean and clear! . . . Interesting!

: I own several differet ham radios, Radio Shack, Alinco, Standard, and

: Icom; however the Icom is the only unit with muffeled sound when I
: transmit from the built in mike. (Very odd)

: I plan on calling Icom about this and I'll post an update regarding this
: issue, but until then:

: Are there any other Icom IC-T2A users out there that have seen this
: problem?

: Are there other IC-T2A users out there who don't have this problem?

: 73,

: Bob
: KF6JHG

I'm not too familar with the t2a, but on some other Icom models, the above
problem was caused by the mic element not being properly inserted into a
opening behind the front panel..this caused it not to line up properly
with the hole that your voice is supposed to go through.
You need to talk to an Icom tech, who can walk you through removing the
housing from the radio, and properly reseating the mic.

I'm baffled by the behavior of my radio, a TS520. If I'm feeding cw into a dummy load, it shows ~ 250W output (it's specs say 200W output). When I switch to my antenna (a 135-ft dipole, fed by ladder line, with an MFJ ant tuner in the shack) the power meter on the tuner reads only 75W. The SWR on the ant is 1.1:1, so I can't see why the power would drop as it does. What am I missing?

Skip- This sounds like it was almost certainly the result of a
parasitic oscillation 'event'. It's not normal for plate chokes to
burn up suddenly like that. I bet that the last owner had re-
placed the final tubes just before the choke blew the first time.
I'd suggest that, in addition to cleaning up and rewinding the
plate choke, you put in a couple of simple mods which should
prevent your problem from happening again. New plate para-
sitic suppressors and cathode degeneration resistors should
tame that amp. You can get a kit of the parts needed for the
mod for a very reasonable price from Rich, AG6K. He can also
put you on to some excellent articles on the subject of para-
sitics and how to tame them. His e-mail address is
measures @vc.net By the way, I have no financial interest in
his offerings. 73, David

One of the favorite programs for un-zipping is WinZip v 6.0, the 32
bit version for Windows 95. There is another very similar version for
Win 3.x. - all by Nico Mak.
If this all seems to be too cumbersome for you, I will send you the
program on 1.44MB floppie. All you have to do is send me a blank
diskette in a mailer that has your return address, sufficient postage
and put all that in an outer envelope to
R. E. Lay, W9DMK
15517 Delaware Dr.
King George, VA 22485

P.S. I would even throw in the Kentrol software, if you send two blank
diskettes, because I know I've got it on the QRZ CD-ROM - all I have
to do is bring up the CD and extract it.

>Jim VE7JLS

Hi Jim,
The radials need to tie to the antenna at its RF Ground point. In
other words, some of the radials almost have to be spread out across
the roof, preferably at about a 45 degree angle towards the ground.
Ideally, they should be evenly distributed in the horizontal plane,
but any time one of the radials has to make a bend or a turn to avoid
an obstruction, do it. However, the prescribed length(s) should be
adhered to in order to make them effective.

P.S. You're going to get an awful lot of interesting advice on this
one.

Absolutely wrong. It is not illegal to have a transmitter you are
not authorized to operate, unless congress passed a new law last night.
The only way you can "transmit" before you get a license, is to sit
with a licensed ham and speak over his/her radio with their help,
and I heartily recommend it for the interested guy out there!

Ham radio can be great fun, most of them are interested in helping out,
but not all of them. It is good to meet and talk to a few hams with
your questions and concerns, and I also volunteer to answer any
questions you may have. If you live nearby, stop in or call! I am
at UC Irvine, in CA. Good luck.

82. VX-1R: Weird scan operation

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-01 00:00:00 UTC
From: dew@gray.cb.att.com
Message-ID: <60tkq8$cdd@nntpa.cb.lucent.com>
Source record: 164902

The following is a description of some
weird scan operation I have uncovered
with my VX-1R. This is a relatively
new radio (serial 7F013067 purchased
within the last month). Can anyone
else confirm this?

I set radio up for programable memory
scan (between L and U memories) I also
wanted to set the step to 15KHz rather
than the default 5kHz. This I programmed
into both memories. This is on ham
VHF. The upper memory is set to 147.39 and
the lower memory is set to 146.40.
When it scans it stops at 147.30 and cycles
back to lower. If I am set up for 5KHZ steps it
works fine. I tried other values for the
upper memory (scan still set to 15KHz) and here
are my results:

upper memory actual scan highest freq starting low freq
increment scanned scanned (1st time)
------------ ------------ ------------ ------------------
147.39 15kHz 147.30 146.40
147.395 15kHz 147.30 146.40
147.40 15kHz 147.39 146.405 *
147.405 15kHz 147.39 146.405 *
147.41 15kHz 147.39 146.405 *
147.415 15KHz 147.39 146.405 *

* in these cases this value actually increments by 5kHz every
scan cycle

As you can see it is impossible to get the radio
to scan the normal band plan between 146.40 and
147.39 with a step of 15kHz.

My conclusion is that you should not use this
feature with anything other than the default
step setting if you expect it to work as
advertised.

This is an unfortunate limitation, but not a
major one. Even with this I am relatively
satisfied with the radio and its capabilities.

Radio Shack has a new WWV clock. It is made by Oregon Scientific.
If you have priced this unit at other places, it can run as high
as $99. RatShack has it on sale for $39. If you like a very
accurate clock, now is the time to get one.

I believe that this clock is set by WWVB (60 Khz) six times a
day. I also have a German version by Oregon Sci that I paid
49 DM ($29). The Germans have wall clock, watches, everything
that are set by the national standards people. And most of it
is made here in the states!!!!

A screwdriver is a mobile antenna with a motor-driven coil
that can be used on many bands. Many people believe that
this type of mobile antenna is the best mobile antenna.
High Sierra is one brand of screwdriver antenna.

Ken:

The W32A on intermod? Fair to Good.
Audio? Good to very good.
Likes: a very good receiver, good on airband also. Easy to read display,
backliting works especially well. Buttons well spaced. Easy keyboard mod
allows Rx into 800 and 900Mhz range. Doesn't receive 869-894 direct but
the images come
in fine.

Dislikes: only way to charge battery is through radio unless you buy a
drop-in charger. The aftermarket guys are helping out with this.

In my opinion you would be better to learn to send code with a straight key first. Just listen to others trying to learn and don't do what they do - run dits and dahs together. It is real easy to send poor cw with either method. Purists will rely on a striaght key up to about 25 wpm - some much faster - but it seems that the rest of us use iambic keyers in the 20+ wpm range.

I would rather copy 5 wpm code sent perfectly from a straight key than have to sit and decipher 13 wpm code from somebody's iambic keyer that never learned the basics of sending code or who doesn't even know what iambic is. I learned to crawl before I walked. Same thing in cw.

There are far too many in the hobby who have forsaken this art - I take may hat off to you and wish you the best of luck.

73 from one who loves cw but can't put enough time into it to send perfectly - either with a straight key or iambic keyer! But at least I try every now and then...

I did a little more investigation
on this problem and I think I discovered
the unwritten restrictions on this
feature. First the upper and lower
limits must be programmed in 100KHz
increments (last two digits 0) and
second the upper limit must be
= lower freq + N*step. As far as
I can determine the scanning does
work as expected if you follow these
rules. This does impose significant
limitations, but the good news it does
work. I accomplished what I was
trying to do with freg lower = 146.40,
freq upper = 147.60 and step = 15kHz.

The following is a description of some
weird scan operation I have uncovered
with my VX-1R. This is a relatively
new radio (serial 7F013067 purchased
within the last month). Can anyone
else confirm this?

I set radio up for programable memory
scan (between L and U memories) I also
wanted to set the step to 15KHz rather
than the default 5kHz. This I programmed
into both memories. This is on ham
VHF. The upper memory is set to 147.39 and
the lower memory is set to 146.40.
When it scans it stops at 147.30 and cycles
back to lower. If I am set up for 5KHZ steps it
works fine. I tried other values for the
upper memory (scan still set to 15KHz) and here
are my results:

upper memory	actual scan increment	highest freq scanned	starting low freq scanned (1st time)
147.39	15kHz	147.30	146.40
147.395	15kHz	147.30	146.40
147.40	15kHz	147.39	146.405 *
147.405	15kHz	147.39	146.405 *
147.41	15kHz	147.39	146.405 *
147.415	15KHz	147.39	146.405 *

* in these cases this value actually increments by 5kHz every
scan cycle

As you can see it is impossible to get the radio
to scan the normal band plan between 146.40 and
147.39 with a step of 15kHz.

My conclusion is that you should not use this
feature with anything other than the default
step setting if you expect it to work as
advertised.

This is an unfortunate limitation, but not a
major one. Even with this I am relatively
satisfied with the radio and its capabilities.

Marty,
Straight keys are great for learning to send PROPERLY.

The alternative is not "iambic" but a "keyer" which is
not necessarily iambic. I use a keyer which has iambic
capability, but don't use that mode.

And I use my straight key just as often.

Depends on preferences and budget, Craig.

They all work. Read the specs on the WEB sites.

If you just want the best, get a Ten-Tec Omni V or VI.

No, in some countries they still have a modicum of respect for the
idea of "personal responsibility." Passing laws that restrict the possession
of an object is ridiculous. Passing laws against the *illegal use* of
that object is a bit more meaningful.

I went to RS and looked at their WWV(b) ("Atomic") clock. The U.S. version seems to only do 12 hour AM/PM time (with alternate time zone), but NO 24 hour mode I could find in the manual, on the instrument, on the price tag or in their catalog!

Bummer... I would have bought one if it did! Let's face it...the WWV(b) signal comes to the clock in 24 hour format! It would have been easy to leave that format available in the first place! Too bad Joe Sixpack and lack of market understanding has once again influenced a product he is most likely not interested in owning, and alienated the very type of person who is most likely to buy one!

Smooth Move RS! Grrrrrr.......

I'm learning code using the Farnsworth method; while I couldn't copy characters sent at the 5 WPM speed, I can copy the characters sent at the 18 WPM speed (with a 5 WPM -> 13 WPM spacing).

I start learning each character at 5 WPM spacing and as I practice, the speed increases to the higher and higher rates. The Farnsworth method help me avoid counting dits and dahs and helps me focus on the "music" of each letter.

The range I can copy at is still narrow, but I hope to expand this with a lot more practice. Overall, I found the Farnsworth system to be very helpful in learning code. Still, no matter what, it takes a lot of practice EVERY DAY.

N1PGW Harry A Webber

Does anyone know how to reach Harry Webber N1PGW?

I have my cashed check for $375 (cashed 08-04-97)
and the UPS Strike etc has confused matters, but I
was last promised a tracking number several weeks
ago. No package or tracking numbers received.

I need to get in touch with Harry to determine what
has happened as this really dragging out...

We made our deal for the FT-101zd and SP-901 speaker
back on July 28, 1997. That was a long time ago!

Any help greatly appreciated.

Funny thing was that when I went to HRO, we checked 2 other ICOM IC-T2A
HTs. Both the other units had the same audio problem. It sounds like a
design problem to me.

The ICOM Tech I spoke to said, "I haven't heard of this problem." No
surprise,
When I worked in Epson's Technical Support Group, we were told to say such
things rather than tell users there's a design problem.

Oh well, I'm sure it can be fixed,

My understanding is that the mod for transmit is the same as on the 8500--cut the green wire near the front of the transmitter and reset the radio. I haven't tried this on my radio, nor do I even know if there is a green wire.

I haven't heard anyone that has extended it into cellular coverage.

If you get the beefy spring loaded belt clip (from the commercial version),
it clips very nicely on most ashtrays. Mounted this way with a speaker mic
it works quite well.

You'll find its quite hard to find a radio chest harness that fits the
FT-50. Most are designed to hold big Motorola or Icom radios.
You might check http://www.searchgear.com/ though. They at least make a
real nice cordura case that goes on your belt.

This is a feature not a bug. To turn the light on full time you press FNC then the light button. The light is now on full time. Do the same thing to turn it off. It's all in the manual.

As I said in my original post, that I bought my unit in
Germany which is set up for the Frankfort time signal and
has a radius of 1500 km (it has "trouble" receiving here
in the states). Oregon Scientific makes two versions for
Europe, one for Britain and one for Germany. And there
are many other firms selling as well. I have even seen
watches that are regulated by the time signals.

Hi Dan,

There is a german company called SSB Elektronik. They make high-quality transverters for several bands. Their equipment works fine with the TS-850. I tested that myself, and many of those stations here in DL usually winning good places in 2m contests use the combination TS-850/LT2S (SSB's 2m transverter). Email me if you need their address. Also try searching the www, as far as I know, they have a web page.

153. Re: Code Test Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-02 00:00:00 UTC
From: Howard Gould <w4nvf@avana.net>
Message-ID: <01bcceeb$e9f4c420$db3d2acf@howieg>
Source record: 164769

Whenever I hear chatter about morse code and how it is so tough I perk up. Since I have been involved with it for say my past 42 years in ham radio it really does not matter what method is used whether you slow every thing down to normal speed or give it a farnsworth twist by playing with the character speed which is only giving you a longer recover time between words. The thing about morse code no matter who is giving the test is the ability of the applicant to hear it and understand the music involved. Not everyone can handle the morse code and that is not a macho man thing but rather fact. You either can understand the language or you have a great difficulty hearing it as a piece of music. The tone can be a major problem for some applicants but if the VE doing the testing as I do has a knowledge of this by asking the applicants if the tone is ok, can adjust the tone for that applicants ear. There are no set rules in giving the exam as some would think. The law of the FCC lets that be with the VE doing the testing. A sending requirement can be initiated if the VE sees fit to do it. The Ve can relax the applicant prior to the actual test with a fair amount of code practice to settle his or her nerves and is done quite often in our exams. The objective of the VE is to see the applicant pass the test rather than fail and the applicant must have some hard earned study before taking the exam. We do not give away ham tickets they have to be earned, but in the same respect, the VE has to respect the right of the applicant to have a fair exam. My last comment on the code is listen carefully and hear the music. Thats all there is to it for most individuals and for those who think it is mumbo jumbo, they are right, but it won't change things. There is a lot of resistance in other countries and some in the USA to the morse code requirement and it very well may become a thing of the past, but for those who use it as a second language it will continue to give them pleasure and communication with the world.

160. TM-241A

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-02 00:00:00 UTC
From: Patrick Conlon <pcon@earthlink.net>
Message-ID: <01bccef9$42d587c0$b414d9cf@pcon>
Source record: 164776

Does anyone know if the Kenwood TM-241A can be used as a repeater for my HT
??
I use my HT in my office but can't hit any of the far repeaters. I would
like to
use my HT to transmit to my car where I have the TM-241 and it repeat my
signal up to 50 watts. Is this even possible ????

Thanks
Patrick

161. Need a bit of advice on a KLM amp.

Newsgroup: rec.radio.amateur.equipment

Source record: 164777

Howdy! There's a gentleman over in rec.radio.swap that is selling a KLM PA10-140 2 meter amp. He believes that it is FM only, no ssb. 10 watts in, 140 watts out.

What I would like to know, if anyone here is familiar with this model amplifier, to please tell me if this amp is capable of SSB and CW use. I have a KLM 2000-A 2m all-mode that I sure would like to get more than 10w out on SSB!

Questions, comments, etc, please to r_brown@getonthe.net . Much appreciated!

163. Re: ICOM IC-T2A 2M HT, Audio Problem in Transmit

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-02 00:00:00 UTC
From: David Little <dalite01@sprynet.com>
Message-ID: <60vj3s$c5n$1@juliana.sprynet.com>
Source record: 164779

If this unit is made like the IC2ia, there is not an opening
for sound to reach the mic. It depends on transfer of
vibration through the plastic front. The best way to solve
this problem, (provided they are the same in design), is to
carefully take the unit apart and remove the mic element.
There should be a "dimple" on the front cover within the
area that the mic fits in from behind. Use a drill bit that is
same size as these "dimples" on the front panel and drill
the one over the mic element position, providing a path
for audio. This mod is published on the various radio
mod ftp sites for the IC2ia. I know it to be accurate, as I
encountered the same problem with my 2ia, and this
cured it.

Hope this sheds some light (or audio)

I run my 530 as a mobile so I have the light left on all the time.
Robert is correct. Pressing the F/M button and then the light button
will toggle the light to stay on or off. Pressing the light by itself
makes it only stay on for a few seconds. Your radio is doing what it
is supposed to do....and that is being one of the best ht's ever on
the market.

The IC-730 is amateur band only cutting R-48 OR the " D " wire on the
RF board will get you the 10, 18 and 24.5 MHz WARC bands transmit.
The radio does not have a general coverage receiver so it will not
transmit on most MARS frequencies.

On Thu, 02 Oct 1997 00:19:22 GMT, martyt@pobox.com (Marty Tippin) wrote:

>I'm in the process of learning CW so I can upgrade to General class, >and am wondering whether I should learn to send with a straight key or >with a set of iambic paddles that I can use an electronic keyer. I >understand the iambic paddles take a while to get the hang of - but if >one has no experience with either kind, it shouldn't be that big of a >hurdle, should it?

In the final analysis, it's personal preference plus hardware considerations. For example, my Kenwood TS-450 does not have a built in keyer, but my IC-751A does. So, if I were to choose to use an Iambic paddle, I would not be able to use the Kenwood, I'd be stuck with only the Icom rig. (That is, unless I purchased a standalone keyer for use with the Kenwood.).

Then there's the KISS principle. Keep It Simple, Stupid.

I don't like to have the complication of an Iambic paddle in comparison with a straight key. Of course, when I use my Vibroplex Bug, that's plenty complicated. The electronic keyer is another story - that's definitely an extra complication.

Now we get to an issue that is extremely subjective and possible inaccurate. It has been my experience on CW that I can tell when a person is keying with Iambic plus electonic keyer. It has also been my experience that such an arrangement seems to cause more miscellaneous and superfluous dots and dashes than ever occur when using a straight key or a bug. Based on that experience, I can only say that if you do decide to use the Iambic plus electonic keyer, please stay off the air until you've mastered it, because my CW copying ability is beginning to decay from disuse, and when I do get on CW it's even more discouraging to me to have to decipher the LID's. Thanking you in advance.

>
>Bob, KI8AB

Your story is also baffling. First of all, I'm surprised that there
is a Kenwood rig that puts out 200 watts. I would have thought that it
was a 100 w rig like most other HF rigs. You haven't made it clear
what your measuring equipment is for the measurement of power output
into the dummy load. Apparently it is NOT the same power meter as
used in the Tuner.

If the SWR were significant (say 2 or 3:1) then I would say that you
are suffering some sort of shut down of the rig as it protects itself.
However, you say the SWR is 1:1, so we'll go with that. The only
other thing that I can think is that you are making some sort of gross
error in measurement of Power OUTPUT, when tuning into the dummy load.

I certainly HOPE that you're not giving us the 75 watt reading on the
tuner under conditions of SSB voice peaks. That reading would not be
very meaningful at all without knowing a whole lot of other things
that you haven't told us (such as the meter's damping factor, how hard
you are modulating, etc.).

This may be heresey to many but ... If your're just learning and you know you want to use a keyer in the future, go ahead and learn using a keyer. I don't see any point in learning a straight key then learning the paddles later. I'm not sure that I would recommend learning on a bug (semi-automatic, i.e., Vibroplex) before a straight key, but really, today's keyers can get the speed down low enough for beginners and still sound good. FWIW, I am devoted to the straight key, but hey, you still have to learn the code to get on HF, but there's really no good reason to learn to send twice if a keyer is what you want anyway.

P.S. -- Sending 13 WPM is no problem at all on a straight key. Actually, up to 20 - 25 WPM is no problem. So, don't be afraid of the pump handle if that's what you really want.

>Larin
>KB9RBJ
These amp's were designed and made by my friend Abe Brewer out of Porter
OK. They are really only made for use on 11m, but you can no doubt see
some output on 10, 12 and possibly 15m, I would think the gain would
drop off below this due to the narrow band input circuitry. You could
consider re-designing the input using Jerry Sevicks book and some new
toroids but that's up to you.
I used to use one of Abe's 8-pill's in my mobile on 11m back in the
70's, it surely kicked a.. (front page of CB/S9 June 1980)

PS. Your amp only has a simple low pass filter in the output so you may
also want to rip that out to allow 10m operation, alternatively build
yourself a real mans amp from Lee Martin at RF Electronics in SC.

(((73))) and good luck

Phil G4ZOW/M
Above 1500w, S-units are not inexpensive.

186. VX-1R Cross Band poll

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-02 00:00:00 UTC
From: jmcghee@cyberramp.net
Message-ID: <610v2mevu1@newshost.cyberramp.net>
Source record: 164802

Hi All,
Thanks to a post from Dale Goodman KD4CVR, I've been able to get my VX-1R to receive on one band and xmit on another. I had to take it back to Texas Towers (don't tell them I told you to do this ;-)) and get them to give me a newer radio. The one they sold me last week was revision A101 whereas the one I got yesterday was A105.
I know crossband doesn't work on A101 and DOES work on A105. What I'd like to know is what is the lowest revision number that DOES work.

If you don't know how to tell your revision number, turn the radio on while holding the AR button. Press the AR button about 6 more times and you will see A10x. Thats your firmware revision number. (I had to tell the guy and Yaesu how to do this!!??)

Crossband are programed just like 'Independent Tx/Rx Frequency Storage ("Odd Splits")' on page 32 of the manual.
Store the receive freq as normal with NO offset.
Change bands and enter the xmit freq with no offset.
Hold Fw for one second, use the knob to change to the same memory, but this time hold in the xmit button while you press the Fw again. This tells it you are storing an xmit freq.
If it worked, you will hear the same beep you hear when storing a normal freq/offset and when you go to that memory you will see both the + and - to indicate it is an 'Odd Split'.

Please let me know know what revision you have and if you can do crossband repeat. I'll report back here if I get enough response.

Also...
Does anyone know if the firmware is in flash memory and if it can be upgraded by the new ADMS program when it comes out? Or any other way?

Thanks in advance,
Jim McGhee N5FZT

187. FT-8500 Help Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-02 00:00:00 UTC
From: Paul Vincent Craven <paul_craven*nospam*@raccoon.com>
Message-ID: <6109qj$8oh$1@gail.ripco.com>
Source record: 164803

I just got a Yaesu FT-8500, and I am having problems getting the V+V receive to work. If band A is at 146.76 and band B is at 146.49, I can neither receive or transmit a signal, based on listening with a hand-held in the car. Is this normal? I expected some sensitivity loss, but this is ridiculus!

If the freq's in band A and B are the same, or I operate V+U, there is no problem.

Help!

(Remove nospam before replying.)

>Craig

I *like* that radio, but I sold mine. The IC-821H looks like a nice
combo rig too. But I bought a pair of Icom Twins for this purpose.
I like the flexibility of having separate radios for each band. The
major problem with the FT-736R is that you can't listen to both
bands simultaneously. That's not important for satellite work,
but it is very useful for terrestrial work.

Source record: 164808

On Wed, 01 Oct 1997 18:13:32 GMT, jmorris@nemonet.com (John Morris) wrote:
>What rigs do YOU like for mobile use?

Well, I'll tell you what I *have*. I have an Alinco 570T, an Alinco 590, and a Yaesu FT-8500. Of the three, I like the 570T the best, but due to mounting issues, I have the others to solve particular mounting problems. What I *really* like best is a trunk mounted GE Mastr II, but the GE isn't a dual bander. So the GE has wound up being my shop radio.

Note that I depend on the vehicle radio to act as a range extender for my micro-HTs (a Yaesu VX-1R and a Standard C508A). All three dual banders can do that via the crossband repeat function.

The GE has much the best receiver. It is virtually imune to IMD and overload. The others need a bandpass filter inline with the antenna to prevent howling when in a high RF area. That's easiest to do with the 570T since it has separate VHF and UHF antenna connections. The others have to be split out with a diplexer, run through the filters, and either recombined with another diplexer to feed a dual band antenna, or used with 2 separate antennas.

What I'd *like* is a dual bander with a tightly filtered and bandlimited receiver free from IMD and overload problems, but there doesn't appear to be anything like that on the market.

I'd like it to have a detached control head which does *not* require the microphone to be attached. The 590 has a detachable control head, but the mic is attached to it so that mounting it up where it is visible on the dash leaves the mic cord to get tangled in the steering wheel. The FT-8500 has the control head and the mic separate, but the controls are on the mic instead of on the control head. That's turned out to be a real hassle. I want the knobs and buttons on the control head.

I'd like the radio to be capable of 110 watts output (but with selectable lower power settings). The GE does 110 watts, but isn't easily throttlable below that without going inside the radio. The others range from 35 to 50 watts, which is sometimes not quite enough. This isn't a major want, I can live with 50 watts, but 35 is often marginal.

I'd like the radio to be well enough thermally designed that it doesn't need a noisy fan to keep it cool. The 570T and the GE both do that, but the others need fans. Fans have several drawbacks besides the noise, and I'd rather have a radio which didn't need one.

I'd like the ability for the radio to be fully remotely controlled from the HT. There are a few of those on the market, but they all suffer from such poor receivers, poor thermal design, or both, that they aren't even in the running.

What I *don't* want is out of band operation, nor do I want the ability to double as a scanner if it is at the expense of good in band performance. Unfortunately, those misfeatures seem to be on every late model radio. And I don't need lots of memories or alpha tags, I *know* the frequencies I use, and I'm perfectly capable of dialing them in when I want to use them. (I don't *care* if these frills are on the radio or not, as long as they don't make the radio more difficult to use, or drive up the cost unnecessarily.)

I *don't* want overly complex or clumsy control systems which require you to carry the instruction manual with you in order to do basic radio functions. Both Alincos are pretty good in this respect, but the Yaesu is a disaster. I need to be able to dial in frequencies, set CTCSS functions, and go simplex or reverse without having to push alt keys, go into menus, or otherwise do convoluted gyrations. I'd accept softkeys to keep the control head clutter down. I really like the way the IC-706 works in this respect. I think its control system is inspired. But even better would be *user assignable* softkeys, so I can group the functions *I* use most together.

In summary, there isn't a dualbander I *really* like available now, but I've managed to kludge up systems I can live with for the moment.

There's no question in my mind on this one. The very worst is the Kenwood TS790A. It appears to have been designed by idiots. You can fit narrow filters, but not in the subband receiver. Yet that is the receiver you must use when operating satellite. And the track tune feature is totally bogus.

Thermal design is also horrid, this thing runs *very* hot in transmit, and it is likely that you will lose one of the PA modules if you operate much with continous duty modes, IE data or FM. I lost 2 in 3 months. And Kenwood service performed to its usual inept level. The new modules ran hotter than the old ones (they weren't matched correctly). I fixed that, but efficiency is still pretty poor, and heatsinking woefully inadequate.

: I want to _fully_ remote control a Kenwood TM-V7 transceiver. The DTMF
: mike unfortunately does only allow for frequency changes and similar.

Perhaps you can be more specific about what it is you need to do.

The TMV-7A allow you to control from the mike remote-

Visual scam
Tone/CTSS
Reverse
1MHZ Step changes
Monitor
Frequency readout beeps
Volume control
Dual Band RX
Squelch
TX change
Band select
Frequency & Down

See page 77 of your manual.

For remote operation from an HT
(down load document AAN-0020A.JPG &
AAN-0020B.JPG from the Kenwood FTP site in the applications notes
directory).

You can control the following functions with touch tone from a hand held
remotely on the TMV7

Rev on Rev off

Tone on Tone off

CTSS on CTSS off

Tone Select

Call VFO Memory UP & DOWN Functions for thos features.

Power Level

And you can turn on and off the cross band repeat and change the
frequencys.

Hi there
Here are the facts:
1- I have a G5RV at 22 feet and can't go higher. (Installed flat top)
2- I am limited to the 80 meter band for now. (legally)
3- I could install a vertical on the house with the base at 22 feet over the ground.
4- I can't or won't install a tower, too expensive.
5- I would love to work DX on 80 meter.
6- I will be using other bands when I pass my 12 wpm cw test but that could take a year, so I am stuck on 80 meter for now.

Questions:
Would a vertical be much better for everything considering my height limitations?
Would DX be much better on 80 meters with a vertical?
What vertical antenna(s) would you suggest?
Are there good verticals that don't need radials and do they really work?
Is a trap dipole better than a G5RV? (Reduced length, no space.)
Opinions and suggestions sollicited please.

>Any suggestons or similar stories?

>Barry KI8BS

By "break-down" do you mean you have desense, or is it physically arcing or providing a weird load to the radio or antenna?

Did you have to replace or repair or change the radio after the lightning strike? Did you put in a receive preamp? Is the coax still in good shape after that strike? This problem could be cause by several contributing factors having little to do with the duplexer.

If it is the duplexer, it may be out of tune. Proper tuning of a duplexer simply cannot occur at the factory IMHO! They can tune it to frequency but not to your specific environment (antenna, length of coax, other radios at the site, etc.). You sometimes have to lean things one way or the other to accomodate real-life conditions at your site. This is best left to someone with the right test equipment who knows what he is doing and can't be done properly "by ear" due to all of the inter-dependent factors involved.

These things can be VERY touchy, and a 1/16 turn of the right adjustment can make all the difference in the world. Try to do it by ear and you can get so far away from "correct" with so little effort it isn't funny!

ALL THIS EQUIPMENT IS IN ITS BOX UNOPENED AND BRAND NEW
I ordered an extra set of this top of the line amateur radio
enthusiast equipment and need to get rid of this hardware before
Christmas :^)
I have all the accessories to connect the handheld equipment to your
PC and program it, connect it to your car (cb style), or go mobile with
it. You'll love this stuff!

I. Yaesu FT-50R PC Programmable Handheld Transceiver

Wide Multi-band Receive 76-200, 300-540, 800-999 MHz
3-Selectable Rx modes (AM and Daul FM [FM-Narrow, FM-Standard])
5/2.5W Ultra Compact Construction
Rugged MIL Spec MIL-STD 810 Rated for Shock and Vibration
Auto Range Transpond SystemTM (ARTS) uses DCS to automatically
poll
other stations, indicating if they are within simplex range.
Digital Coded Squelch (DCS) is used in the commercial industry,
DCS
provides 113 unique codes in addition to the standard CTCSS tones.
112 Memory Channels each stores offset, CTCSS/DCS Encodement &
power
level.
Alpha-Numeric Display up to 4 characters may be used to name
each
memory channel.
Digital DC Voltage Display monitors current battery voltage.
MARS/CAP Modifiable with proof of permits.112 Channels
5/2.5W Ultra Compact Rugged MIL Spec Modular Construction
Full 5 Watts Power Output at DC 9.6V with 4 selectable power
levels
RX/TX Battery Savers
Direct FM for Better Voice Clarity
Alphanumeric Display
Unique Water Resistant Clam Shell Design Permits Rear Mount
Battery
Digital Voice Recording System
Check the Yaesu Site, http://www.yaesu.com/ft50.html
for specifications link on this great product

II. Yeasu Rubber Case Protector Fitting FT-50R

III. Yaesu ADMS-1c Advanced Data Management System

3.5" HD Diskette with Windows PC Program
Serial Interface Cable to Connect to a 9-pin Port
Allows Keyboard and Menu Programming for FT-50R

IV. Yaesu Cigarette Lighter Adapter

V. Yaesu Voice VOX Headset (2way)

VI. Yaesu FNB-42 Ni-Cd Battery

DC 9.6 V 1100 mAh

VII. Yeasu CN-3 Antenna Adapter

BNA to SMA Adapter

VIII. Diamond K-601M Antenna

UHF Hideway trunk Mount
6 ft. Teflon Coax PL-259 Adapter

IX. and X. Maxon 49 49 MHz Two Radio (Quantity 2)

Portable FM Transceiver
Offers VOX Voice Activated Command or Standard Push to Talk
Unique RX/TX Signal Through In Ear Microphone

If You are interested in this equipment, please make sure to reply
via e-mail, as my ISP has a pretty shoddy newsfeed. Thank you.

Regards,
Anup

HI !

Living in center of a belgian city, I face serious space restrictions
and can not hang up long wire antennas for the 80 and 40 meter bands.
So, I recently purchased a Butternut HF9V-X vertical.
I wonder if any users of this antenna want to share their experiences
with me ?
In particular, I wonder how this antenna performs on the lower bands...

Tony,

It seems that Kenwood repair services have been getting much better. It
is good to know that other customers are being treated well. Several
friends have commented on the fast, efficient turn around times. Not
like before, it seems that Kenwood is providing good service these days.

Go Kenwood!

Learning and testing morse code are not the same thing. I learned at
15wpm Farnsworth using a computer program. I agree it is the best method
of learning but a 5wpm test is precisely that not 18wpm character speed.
I would be a little upset if I had learned at 5 and was tested in
Farnsworth mode.
My morse tutor can be found at kay-dee.demon.co.uk.

Hey you "new" guys - the TS520 has tube finals! No need for shutdown circuits for high SWR. If the plate current will dip, it will work. I believe it has 2 x 6146B in the final. Those should be good for about 200W PEP *INPUT*. Output would decrease as you go up in freq, but should be around 60 - 70 percent or so of input, less on 10 meters. Do your measurments with CW, not voice peaks. See if you aren't closer between dummy and antenna.

I had an opportunity to pick up the following items. How do I go about determining their used value (all in clean, full functional condition with manuals)?

-Kenwood HF SSB Transceiver TS-180S with 160, 80, 40, 20, 15, and 10m bands. (WWV (10.0 MHz) SSB/CW/FSK, desktop mic, Kenwood Speaker SP 180, and PS-30 power supply. Has D.F.C. memory unit upgrade.

-DenTron MT-3000A Antennae Tuner and DenTron linear amplifier MLA-2500B.

-Computer Patch Interface by AEA (model CP-1)

-Heathkit Hybrid Phone Patch (HD-15)

-Alliance Dual Speed Control beam antennae rotator
and a Vibroplex key.

-Microlog Corp's ACT-1 keyboard to code.

Greetings,

To those of you who have been following this story I am glad to report that Richard R. Schippel, Jr.\KB8WTR has as of this morning returned ALL of my property, and as best that I can determine in the same shape he received it. I will be returning his personal check before the day is over. I really appreciate all the supportive mail I have received and wish to thank those of you who provided that little "extra" support.

A lesson to be learned here? You bet! There are people out there that will try to take advantage of your trust! I knew that but I have never had the misfortune to run into one!

Thanks again to all!

Respectfully,

Roger K. Cole

Have for sale: CSI (Connect Systems Inc.) Micro Patch, Model 9800D
Multi-Mode Interconnects.
These units were used for a 45 day period in Alaska,1994. They have
been in storage the rest of time. The units look as new, and include the
optional 9801 Electronic Voice Delay. I also have "Users Instruction
Manual" These units are current models, and Ham Radio Outlet sells
the 9800 for: $749.00, and the optional 9801 for:
$139.00.
For complete information and specifications, please see:

http://connectsystems.com/cs9800d.htm

I am willing to "swap" these for: Ham equipment. Or Sell for $250.00 ea.
Please contact me via-email jeepham@ix.netcom.com
Thank You, and 73 Darrell N6ZKV

I'm looking for an external box that will turn any mike for a radio into a vox mike. I have a throat mike I would like to use with vox on a Standard 156A. I've heard that radio shack stocks something like this but the guy at the local radio shack had no clue. All we could find was something for the motorola commercial stuff. Can anyone point me in the right direction to find something like this??? Please reply by e-mail

Wow...why do people do things like replacing sweep tubes
with 6146's!

I just purchased a new-old-stock matched pair of Sylvania
6HF5's from Antique Electronic Supply of Tempe, Az. Seems
that they have lots of already matched pairs in warehouse
bins...they did not charge me extra for matching (I asked
the salesman over the phone if he could check stock to see
if he had Sylvania...these were the matched pairs). Price
was $34.00 with shipping. Not bad considering real 6146B's
are twenty bucks each.

I would recommend replacing the 6146's with the 'HF5's only
if you are experienced with such surgery and are willing to
track down the sockets for the 'HF5's (this may be more
difficult). Neutralizing a Swan of this vintage is a
little tricky also.

Good luck...don't get in too deep. Remember, if all else
fails, you still have a fine receiver!

>Wanted: Manual for Kenwood TM241A. Also any information available to reset
>microprocessor. Presently it appears the FREQUENCY LOCK is engaged. I am
>not able to reset the transceiver.

I will assume that you do NOT refer to "Memory Channel Lockout", but
rather to the "Lock" and "A.LOCK" feature. If "Lock" is ON, the word
"LOCK" will appear in the upper left corner of the display, and the
panel keys and the tuning controls will be disabled.

To reset this condition. press "F", then within 10 seconds press
"MHz/Lock".

If the "A.LOCK" feature is on instead, the reset procedure is entirely
different. Turn power OFF. Then turn power on while holding down
the "MHz/Lock" button.

If you want a copy of the manual (58 pages), send me a SASE with
sufficient postage for 29 pages of 8.5 x 11 paper along with US $3.00.
I will photocopy my manual and send it to you.

I would not attempt to FAX 29 pages because my FAX provider is a
laundromat that charges $1.00 per page.

I will be happy to e-mail answers to specific questions, such as the
one above, at no charge.

Oregon Scientific sells a great 24hr digital clock that also includes the temperature.

The digits are approx 1" with the temp(F or C) displayed on top and the time on the bottom in either 12 or 24 hour format... no seconds displayed. Have had mine for about a year and seems to be very accurate... around 1 min per year... cost if I remember right is about $24... If you live in California, Fry's has them.

Check out Oregon Scientific's web page:
http://www.oregonscientific.com

They make a lot of the stuff at RatShack. And it seems like
everyone else sells their stuff too.

252. TX / RX Duplexers - User Comments, Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-03 00:00:00 UTC
From: byoumans@neo.lrun.com
Message-ID: <34346208.2305389@news-server>
Source record: 164671

Anyone using a set of duplexers by TX / RX for use on an amatuer repeater?

Our club has a 4 can duplexer from that company and is experiencing serious receiver desense.

The unit did work well at one time and then was hit in a lightning strike. It was returned to the factory for repair and re-tuning but has not worked properly since before the lightning strike.

The duplexer works as expected with 5 to 10 watts but than seems to "break down" at high power levels. We used to run 120 watts with no problems. The factory seems unable to resolve the problem.

Any suggestons or similar stories?

266. HF Mobile - RFI to cruise and wipers on 40m only?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-03 00:00:00 UTC
From: dbossel529@aol.com
Message-ID: <19971003052701.BAA03765@ladder01.news.aol.com>
Source record: 164685

I have a Yaesu FT-900/CAT and a screwdriver antenna in my 1994 Chevy S-10 pickup. I operate all HF bands at 100 watts. Have grounding straps all over the vehicle. The antenna is at resonance and matched for 52 ohm feedline and I have less than 1:5 SWR on all bands.

Would any one have a clue as to why, on 40 meters only, would I get R.F.I. into my windshield wipers (they move with my keying, get some strange looks on sunny days) and the cruise control (disables it)?

The screwdriver ant is on the right rear of the shell and have a 5/8 wave whip for 2 mtrs in the center of the cab roof.

Have tried removing all the 2mtr stuff, including the antenna, and didn't make any difference.

Ever tried monitoring cw on windshield wipers? ;-) Any input would be much appreciated.

Send it to ICOM it can be fixed. There are adjusting the position on
the mic element so it is in a better position to pick up the audio
provided from the audio channel that is coming from the speaker holes
in the front case.

One of the CW skills that is often overlooked is the 'fist'. A good fist sends CW that is for the most part error-free with a consistent cadence as well as speed. A good fist is easier to copy at any speed.

Learning how to work CW will be difficult enough. Learning how to operate a keyer at the same time will only complicate matters.

I have an I-177B Tube tester complete with the separate outboard adaptor for later style tubes. This tester is the predecessor to the venerable TV-7. They are very similar in both appearance and operation. The tester is in A-1 excellent shape. The adaptor is in good shape except for a crack in the large porcelain 7-pin socket. The socket still appears usable and I also will include a spare socket. I have all the manuals and associated tube data. I'm asking $95 OBO + shipping.

There have been messages posted showing that you can do useful things
with a FT-50R by editing the ADMS file on your computer and uploading
back to the radio.

(See www.dejanews.com looking up FT-50R in the old and new sections.)

This requires a Hex Editor, for which some people are still using
PC-Tools for DOS on 5-inch disks.

I am happy to say that I found a new Hex file editor for Win-95.

It is called FXEDIT vers 2.4, ***FREE*** from the usual download
sources. Not even shareware, but free.

Even if your ADMS software runs on Win 3x, you can sitll edit the file in
Win 95.

Message-ID: <613b3e$ga7$1@calvin.risq.qc.ca>
Source record: 164707

Hi there
Here are the facts:
1- I have a G5RV at 22 feet and can't go higher. (Installed flat top)
2- I am limited to the 80 meter band for now.
3- I could install a vertical on the house with the base at 22 feet over the ground.
4- I can't or won't install a tower, too expensive.
5- I would love to work DX on 80 meter.
6- I will be using other bands when I pass my 12 wpm cw test but that could take a year, so I am stuck on 80 meter for now.

Questions:
Would a vertical be much better for everything considering my height limitations?
Would DX be much better on 80 meters with a vertical?
What vertical antenna(s) would you suggest?
Are there good verticals that don't need radials and do they really work?
Is a trap dipole better than a G5RV? (Reduced length, no space.)
Opinions and suggestions sollicited please.
73 de VE2CJW

The Icom x75's are not twins. Maybe they were quintuplets, even when
one ignored all of the A/E/H variants. (275,375,475,575,1275).

The classic twins I know were HF TX/RX pairs from both Drake and
Kenwood where one could lock them together for tranceive operation.

From: martyt@pobox.com
Message-ID: <3436832d.141327587@nntp.a001.sprintmail.com>
Source record: 164512

Thanks to all who e-mailed me on this subject; it seems that the
general consensus is to go ahead and learn with the iambic paddles
rather than trying to switch to them at some later point.

There were also some who advised learning to send with a straight key
first so as to develop a good "fist" and then switch to the paddles
and keyer later on.

I think I'll try the first recommendation; anybody got a good used set
of iambic paddles they want to sell? Let me know if so.

Thanks again to all who replied

>> I think I am missing something here. I thought the SBE-33 was the first
>> all solid state transceiver, not tube. I believe the SBE-34 was also
>> all solid state.

No... the SB33 and the SB34 are nearly identical in terms of circuit design. There are two main differences. The SB34 includes both 117VAC and 12VDC power supplies while the SB33 includes only the 117VAC supply (the 12VDC was an external option). Also, the SB33 was constructed using 1950's techniques (transistors socketed as if they were tubes and point-to-point hand soldered wireing) while the SB34 was constructed mainly on printed circuit cards.

I happen to own a functioning SB33, The good news is that I also have the manual for it. The bad news is that it's currently stored in another state, so I can't easily get a copy.

If the problem is a need to shift the specific frequency coverage of a specific band, it's a matter of identifying the crystals for the 1st converter and replacing the appropriate crystal with one for the desired range. There is no need to worry about damageing a crystal filter by mistake, the SB33/34 has no crystal filter = it uses a Collins mechanical filter which looks NOTHING like a crystal!

Good luck! - Seventy Trees - Glenn wb6w

298. TSU-7 & FTS-22 TONE BOARDS NEEDED

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-04 00:00:00 UTC

Hello everybody,

I might have the opportunity to go to Hong Kong by the end of the Year.
I currently have no equipment related to ham radio. I think it might be
a good place to buy electronics there. Does anybody have an idea or an
address where I could buy some transmitters at good prices ?
I am looking for a 144 Mhz transmitter and performant antennas.
What would be interesting for me is to hear Shuttle and Mir
communications.

So precisely how do you plan to get a voltage high enough to dissipate the 3
Watts? By my reasoning you will need 1.7 million volts.

Bob.

No - not with a single-band mobile.

If you have a dual-band mobile which is operable as a cross-band repeater, it is easy to do...

Providing that your handheld is not in the same band as the repeater you're trying to hit. If you're interested in 2-meter repeaters, then you need to have a 440 (or 220, or 902, etc.) handheld. Your dual-bander won't repeat a signal in the same band.

A little equipment upgrade in order, eh?

I've been trying to select HT for my light packet and heavy "on-hand"
and bicycling use.

This far I've been able to select Yaesu FT-50R and Icom IC-W32A from
several models, but now I'm stuck. Both have equal prices, both are
about same size and both need optional battery pack to get best
performace - Icom has standard antenna adapter, so I don't have to buy
extra one.

Maybe someone could recommend either of these HT's for me?

It is the wrong band.

There is a low pass filter after the amp, that even if it did amplify,
would kill any signal. The tuning circuits within the amp, and the
devices used themselves probably wont go that high in frequency

Message-ID: <615ioe$g1t@bgtnsc02.worldnet.att.net>
Source record: 164572

I am looking for information on the Outbacker antenna. I am a planning a portable operation to Canada in November as well as need an antenna for apartment use. The Outbacker would seem to fit the bill in both cases since the operation in Canada would be from a house. However, all of the advertisements seem to be lacking on information on what accessories are needed to mount the antenna. How does one mount the antenna on say the ledge of a window or on a railing? The ads all mention having standard 3/8-24 threads. What do you use these threads with? Also, is an antenna tuner required? It is one extra piece of equipment I would not like to carry along if it isn't needed.

TIA,
Robert, N2JTX

Of course Boris is almost certainly correct.

A voltage rating ,and perhaps the "3W size" would be better way to
specify this resistor. (Is this what they mean by a "flameproof
resistor"?) I'll bet that this device is intended to measure a very high
voltage at very low curent.

It's probably less by one or two orders of magnitude than the 1.7MV that
Bob calculates, though.

Nope, but then neither does the Oregon Scientific unit which costs
twice as much ($80 at Service Merchandise) to two and a half times as
much ($100 at Sharper Image stores).

BTW, I sent e-mail to Oregon Scientific asking if they had a model
with 24 hour display in GMT, which seems like it'd be a popular
option. They said that they didn't offer this as yet, but were
considering it.

>I am interested in finding construction plans for building a G5RV >10-80 meter version and 10-40 meter version.

Dear Jim,

Visit the Web page that has all the poop on G5RV's - it's worth the visit.

www.geocities.com/CapeCanaveral/8476
by W6RCA. It's very interesting and informative.

I've not heard of a design specific to 40 M. There was an article recently by N4PC in October issue of CQ Magazine that shows a 178 foot long Center Fed Zepp for 40M, and he refers to a "double G5RV", whatever that is. I don't know whether G5RV had anything to do with such an antenna or would even acknowledge it. So far as I'm concerned, the standard G5RV is OK on 40M, so why mess with the design?

You can build a G5RV for less than the commercially built ones. Start with exactly 102 feet of flat-top, overall. Use solid or stranded, insulated or insulated wire - it doesn't matter. It only has to be of heavy enough gauge to keep from breaking, so in the inverted vee configuration it can be very skinny. Feed it with ordinary 450 ohm ladder line of length = 29 to 31 feet. Considerable confusion exits on what is the prescribed length of the balanced part of the feed line. I don't think you'll see any big difference over that two foot range, but I would start with 31 feet and trim it if you get convinced that it could be improved upon. Terminate that with a simple Center Insulator device made of PVC which gives the ladder line some screw terminals to fasten to and provides the necessary PL-259 coax fitting on its bottom. Connect your coax (of length adequate to reach into the shack to your equipment) to this device and get on the air. The coax canl see some healthy SWR's, so use something that can handle your power levels. I have used RG-8 at the legal limit, but I start to worry if I see the SWR on the line getting up to 3:1, and you should too. Some coax is not made with its center conductor in the center, so it may break down at lower than advertised voltages. I am also told that the PL-259 connectors can't take as much voltage as the coax itself.

If you have plenty of extra coax, it won't hurt to put a coil of about 8" to 10" diameter (give it 8 to 10 turns - not critical) hanging close to the point of connection with the balanced line.. That will help reduce RF current flowing on the outside of the shield braid. The commercially made units will sometimes place a string of ferrite beads over the coax at this point instead of the choke coil.

You may get conflicting suggestions, but keep this in mind - the G5RV was designed for 20 M. Anything you want to do to tweak it for some other band is up to you. IT'S NOT CAST IN CONCRETE, and it's not sacred. It's more important to get the part of the antenna with the high current (low impedance) up as high as possible than anything else.

Bob

Have for sale: CSI (Connect Systems Inc.) Micro Patch, Model 9800D
Multi-Mode Interconnects.
These units were used for a 45 day period in Alaska,1994. They have
been in storage the rest of time. The units look as new, and include the
optional 9801 Electronic Voice Delay. I also have "Users Instruction
Manual" These units are current models, and Ham Radio Outlet sells
the 9800 for: $749.00, and the optional 9801 for:
$139.00.
For complete information and specifications, please see:

http://connectsystems.com/cs9800d.htm

I am willing to "swap" these for: Ham equipment. Or Sell for $250.00 ea.
Please contact me via-email jeepham@ix.netcom.com
Thank You, and 73 Darrell N6ZKV

Dont forget to check for desense into a dummy load. Your
antenna may have been damaged also,and could be generating noise when
excited with rf. It could also be an arced over connector on the
feedline.

>73 de VE2CJW
>Michel Morin.
>Quebec, Canada.

Here's what I would do. Since you're willing to mount a vertical with its
base at 22 feet, do that. It should be 1/4 wavelength tall, IE 66 feet
for 80m, making it a total of 88 feet above ground level. Now don't
connect it to the radio, it won't work well anyway without an extensive
groundplane, hang the G5RV from the top of it instead. Enjoy.

Now what I'm trying to tell you here is that a short loaded 80m vertical
is not going to work as well as a G5RV (or any other relatively full size
Hertz antenna). The vertical needs to be at least a quartwave tall, IE about
66 feet for 80m to work well, and it requires an extensive groundplane.
So you're better off just using it as a mast to raise the G5RV. It is Ok
to mount a Hertz dipole as an inverted V, so you only need one high
support.

Relax! Without the humor, this would be a pretty boring group. In fact,
many of those followups do bring up legitimate issues. And, don't forget
that everyone here is doing this because they want TO, not because
they are paid TO. Furthermore, just answering the question in many cases
can lead to an incorrect solution given insufficient data.

Also, are people not allowed to be curious anymore????

336. MFJ SSB Rig...does CW adaptor extend coverage to below 7.15?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-04 00:00:00 UTC
From: olyellr@iglou.com
Message-ID: <343697d8.16852442@news.iglou.com>
Source record: 164593

Am interested in the MFJ SSB rig, particularly the 40mtr version.
Notice in the ads, etc. that it covers 7.15-7.3mhz.

Does anyone know if the optional CW adaptor opens the coverage down to
7.000, to include the entire CW portion of the band?

Any info on this rig is appreciated.

Thanks very much in advance.

Nothin' wrong with humor. When a response starts out "Yeah Right!
followed by (I'm paraphrasing) "Just in case you can't multiply,
here's how you use ohm's law..." That ain't humor...
Followed by "these parts exist, but I ain't gonna give you a hint as to
where..." that ain't helpful.

Many of the "answers" on this net start out, "You mindless twit, you
don't know what you're doing, but I do...and you're wrong in your
assumptions, even though I don't know what they are...but I'm sure you
don't really want to do that...cause I think it's stupid...and I'm sure
everyone else does too...but here's some stuff to convince you that
I'm really smart...even though it doesn't address the question you
asked...
and by the way, here's a comment on the other 20 people who answered you
with incorrect answers...they're wrong too...

Wouldn't it be wonderful if people at least posted an answer to the
question somewhere in all the chaff.

But what do I know...miker

Cableform-Beman makes high-value carbon film resistors with high power ratings. The brochure that I have shows they only go up to 150 Gigohm (10 Watts max, 40 kV max, 6 1/2" long, 9/16" Diam) , however, it also says they make custom resistors on request. You might ask them... They are at:

Cableform, Inc.
Zion Cross Roads
Route 2, Box 1473
Troy, VA 22974-9512

Phone: (804) 589-8224

345. TM-255E / TM-455E General Coverage?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-04 00:00:00 UTC
From: Oliver Welp <welp@muenster.de>
Message-ID: <34360F46.6382@muenster.de>
Source record: 164602

Hi,

does anybody know of a modification for the Kenwood rigs
TM-255E and TM-455E
to get an extended frequency range?

In case you do, please drop me a mail!

Thanks!

73, Oliver
(DL9QJ, N3NSF)

Looking for rx/tx mods for this radio, or a location where same could possibly be found. Hate to buy a radio and not get all of its capabilities. Unable to access ADI's website, doubt it's there anyway.

E-mail or post would be appreciated.

>use 300 to 400 pieces. Surplus parts are fine.

Yeah, right.

E = I*R
W = I*E so
I = W / E
E = (W / E) * R
E^2 = W * R
E = sqrt(W * R)
E = sqrt(3*10^12)
E = 1.73MV

You need to apply 1.73 megavolts across this thing to get 3 watts
through it. If that's really what you have in mind, the resistor
has to be rated for 2 megavolts across the terminals. In air,
you're going to need several meters between the terminals just to keep
it from arcing over. There are high-voltage components available
in such ranges, but they're huge and not cheap.

Hi Barry.

Repeaters can be very frustrating at times!

As you indicate the site suffered a lightning strike almost anything is possible!!!!!

If the duplexer was returned to the manufacturer for repair and, they infact did a good job of it, I would look at the transmitter as the most likely culprit. components in the ooutput circuitry can cause all sorts of problems. Is it possible to look at the transmitter output with a spectrum analizer??? Could be the tx is generating sperious all over the place. We have a UHF Micor where the circulator in the antenna filter was damaged when the antenna contacted a high voltage power line. Everything tuned up by the book, worked great until the Rx and Tx leads were connected to the duplexer. The Rx went totally deaf when the Tx was on.

Hope this helps...They can be fun to diagnose with out the proper test equipment.

It might be that large physical size (3W) is needed to minimize the
surface leakage and also to minimize the field gradient across the
resistor.

I am interested in finding construction plans for building a G5RV 10-80 meter version and 10-40 meter version. I realize it is a simple antenna but I have been unable to find any information on how to actually build one. Even the ARRL Antenna Book does not give this information. If anyone can e-mail this to me, I would be very grateful.

Ordering Information

I accept Visa, Master Card, American Express, and Discover credit cards.

Your most secure method for ordering is to call my order-line open 24 hours a day 7 days a week at 1-800-413-1129, or for international orders call 909-944-1129. You can also fax an order directly to me at 909-987-7761. When you place an order, please include your e-mail address. One way to avoid mistakes is for you to include an e-mail to me of your order and mailing address.

You can also purchase a manual by sending a check to cover the cost of the manual and shipping. Mail your check to:
The Raymond Sarrio Co.
6147 Via Serena St.
Alta Loma, Ca. 91701

You can be sure that the manual you order is a top quality vintage reproduction of the original manual. All manuals, unless noted otherwise, include the full text, schematics, and photos that came with the original manual.

Take a moment to read the unsolicited testimonials from my customers, they provide the best evidence of the quality of my manuals and the service I provide.

I guarantee 100% customer satisfaction. However, if manuals are ordered by mistake, or they are returned damaged, or altered in any way, a 25% restocking fee will be charged. Tnx, Ray WB6SIV

Shipping Costs

All US orders are shipped by airmail, the cost for shipping one manual is $3.00. Each additional manual adds $1.00 to the cost of shipping.

Canadian orders are also shipped by air. The cost for shipping the 1st. manual is $5.00, each additional manual adds $1.00 to the cost.

International orders are shipped by air, $13.00 for the 1st. manual, $3.00 for each additional manual.

NOTE: I do not inflate shipping costs. I keep these charges as close as possible to the actual cost. All costs quoted are is US Dollars. COD orders are not accepted.

362. WTB SWAN 250C

call me at 1-509-882-2661 for wilson tech support
phone number, they can provide either the schematic
or a place where to find a used control box.
that number only good from 8AM to 4 Pm M-F PST

I seriously doubt that the "screwdriver" has anything to do with it.
Make sure the antenna is grounded properly. You may have to provide some
shielding or bypassing to the cruise control wiring.

(snip)

OOPS! My earlier posting may have been a little off topic. Both the SB33 and
SB34 were all solid state EXCEPT for the transmit driver (I think it's a 12BY7)
and the final (a pair of oddball TV sweep tubes).

This is EXACTLY MY POINT. YOU don't understand the application, so HE's
the nutcase. If innovation conformed to your (or any one person's) veiw
of
the universe, progress would be very slow indeed.

Yes, it would be nicer if people posted enough information for you to
understand,
but it's not likely to happen. You can always ask for clarification
with private email.

Even if it is a troll, there's still no benefit to publishing anything
except
useful information for the requester. Anything else is not even
potentially
helpful to anyone. And guess who's ignorance it exposes.

> : mike unfortunately does only allow for frequency changes and similar.
>
> Perhaps you can be more specific about what it is you need to do.

I want to have full control of the transceiver. When the transceiver looses non-volatile settings (or requires a hard reset for some reason), the DTMF control defaults to OFF. There is no way to turn it on with only the mike buttons. For that reason, the front panel seems much more attractive - let aside all the other features that the mike control lacks. Note that the intention is to have reliable unattended operation.

So still I wonder whether anyone has analysed the bus protocol? Is it compatible to something?

Source record: 164435

What do you want with a handheld? VHF I presume? If you save the money and get into the HF bands when you get the license to do so you'll have a much better time. (my opinion)
if you just get to the technician level and quit there, because now you have a licence and a radio, you'll be missing out on most of the fun. Unless there is some real reason to limit yourself to VHF you should go for the HF license and the HF radio.

Also, when you get the radio you can just make up any old call sign to get yourself on the air to test your fun new radio and get your feet wet. Most people won't tell you things like that but if you stick to the right frequencies and don't get stupid about it (doing it only several times) you can give yourself some motivation to get the license and really get into it.

I was a ham at 15 years of age and it was really a blast. The long distance contacts are the most fun and you won't get that on VHF.

The other thing to do to get some good code practice is to send into a tape recorder and then put the tape away for a few weeks and then practice receiving. Just try not to read what you are sending or else it can ruin it for receiving when you anticipate what's coming.

I have a old HW 101 made by Heathkit that I never use any more that I might be willing to part with but I don't know the right price for something like that. Let me know if you might be interested. I would rather see the thing go to someone starting out than some collector.

Good luck.

Sincerely,
Jim Fleming

Este es un mensaje con m&#65533;ltiples partes en formato MIME.

------=_NextPart_000_01BCD186.2142A590

Are you fed up of counting up and down manually you listing of the DXCC
countries in order to know your current status?
Are you tired of copying your listings of worked and confirmed countries
from one sheet to another every time there is an addition of deletion of a
country?
Don't you want to say "I have worked 150 countries, more or less" any more?
Have you ever spent an evening searching that paper or notebook where you
used to trace your DXCC status?

Here you have the definitive solution. The DXCC Worksheet.

HTTP://www.redestb.es/personal/g_sampol

What is the DXCC worksheet?
It is an Excel worksheet that helps you trace your status of DXCC
countries. You only have to fill the cells with your worked and confirmed
countries and the totals will be automatically updated. You don't have to
make any calculation !

What do I need for using the DXCC worksheet?
You need a computer running Microsoft's Excel Version 5.0 or 7.0(97)
Availability for former versions of Excel can be studied on demand.

Which are the facilities of the DXCC worksheet?
It provides an updated listing of the DXCC countries (including the deleted
ones). This listing includes:
Common prefix/prefixes
Name
Continent
ITU zone
CQ zone
Provides information on the date of insertion or deletion of the country.
Allows to enter data for any band from 160 m. to 23 cms. plus a
customizable band (3 cms, etc.).
Allows to enter separate data for SSB and CW plus a customizable mode
(RTTY, SSTV, etc.).
Automatically calculates:
Number of worked countries per band in SSB
Number of worked countries per band in CW
Number of worked countries per band in the customizable mode

Number of worked countries per band in mixed mode
Number of confirmed countries per band in SSB
Number of confirmed countries per band in CW
Number of confirmed countries per band in the customizable mode
Number of confirmed countries per band in mixed mode
Total number of countries worked in SSB in the WARC bands
Total number of worked countries in CW in the WARC bands
Total number of worked countries in mixed mode in the WARC bands
Total number of confirmed countries in SSB in the WARC bands
Total number of confirmed countries in CW in the WARC bands
Total number of confirmed countries in mixed mode in the WARC bands

How can I get the DXCC worksheet?
You can download it from my web site at:
HTTP://www.redestb.es/personal/g_sampol

385. Re: FT-920 Review

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-05 00:00:00 UTC
From: km1h@juno.COM
Message-ID: <19971005.162718.9687.2.km1h@juno.com>
Source record: 164437

Early production problems aside, the FT-920 has horrible TX IMD performance as noted by the QST review. This includes a later model that they also reviewed.
On most HF bands this may not be a problem due to all the existing crud but it can be devastating on 6M. Note that the review also mentioned this.
As has been discussed on the weak signal VHF reflectors, the FT-920 is not something many of us wish to have in our "back yards".
IMO, the blame must be shared by Motorola who developed the MRF-255 12.5V PA FET and the various manufacturers who forced the development and use it in 160-6M "do all" boxes.

>of my address.

another problem using 6146 type instead of sweeptubes is
6146 type never live 18-20 years with heater voltage on. 6146 sicken
and emission decreases when not operated, while the sweep tube does
not have such problems. The 6146B may not last 5 years, while many
sweep tubes may still work after 20 years.

It could be a follow up to the 90Kv stungun....

:and I have less than 1:5 SWR on all bands.

It's hardly suprising you have problems using a screwdriver for an antenna.
Perhaps if you were to stop being so stupid and used an actual antenna
your problems would go away. Sheesh! Some people.

Okay John,

But don't keep us guessing as to where all this is located. I assume it
is down on the ground, or is it still up?

Andy

Ordering Information

I accept Visa, Master Card, American Express, and Discover credit cards.

Your most secure method for ordering is to call my order-line open 24 hours aday 7 days a week at 1-800-413-1129, or for international orders call 909-944-1129. You can also fax an order directly to me at 909-987-7761.When you place an order, please include your e-mail address. One way to avoid mistakes is for you to include an e-mail to me of your order and mailing address.

You can also purchase a manual by sending a check to cover the cost of the manual and shipping. Mail your check to:
The Raymond Sarrio Co.
6147 Via Serena St.
Alta Loma, Ca. 91701

You can be sure that the manual you order is a top quality vintage reproduction of the original manual. All manuals, unless noted otherwise, include the full text, schematics, and photos that came with the original manual.

Take a moment to read the unsolicited testimonials from my customers, they provide the best evidence of the quality of my manuals and the service I provide.

I guarantee 100% customer satisfaction. However, if manuals are ordered by mistake, or they are returned damaged, or altered in any way, a 25% restocking fee will be charged. Tnx, Ray WB6SIV

Shipping Costs

All US orders are shipped by airmail, the cost for shipping one manual is $3.00. Each additional manual adds $1.00 to the cost of shipping.

Canadian orders are also shipped by air. The cost for shipping the 1st. manual is $5.00, each additional manual adds $1.00 to the cost.

International orders are shipped by air, $13.00 for the 1st. manual, $3.00 for each additional manual.

NOTE: I do not inflate shipping costs. I keep these charges as close as possible to the actual cost. All costs quoted are is US Dollars.

394. Tubes for sale

Have about 480 tubes that have been sitting in my storage room for over 20 years. Those that are in original boxs I call new and those that are not in boxes or are in remarked boxes I call used. Have an Excel file with an inventory on it of the tubes. Am looking for a one price take all. If you are interested please contact me via Email at zamir@highfiber.com and I will send you the file via email or a copy via snail mail. Hy

395. Butternut HF9V experiences

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-05 00:00:00 UTC
From: DL7ALM@t-online.de
Message-ID: <617ts6$q72$1@news01.btx.dtag.de>

Hi Egbert ON4CAS,

I bought myself a Butternut HF2V last year. It is comparable to the multi band antenna HF9V. I added the 160m kit. I made very good esperiences with this antenna. But: It is necessary to buid a good ground system ! I layed out about 20 radials, 40m long each.

This is the secret of a good groundplane. I like the Butternut antenna because there is no magic coil/capacitor matching. It is easy to tune and understandable. Have fun with this antenna on the bands.

Hi,

I have forsale in very good condition an Eimac SK-800A
tube socket. This is for the 4CX-1500B. It is used and the
silver plating is slightly tarnished but could clean up to
near new shape
$55, shipped to the lower 48.

Has anyone popped one open to see if there are any "magic
jumpers" or places where a 12/24 switch may have been?

I doubt if Oregon Scientific designed these, as they are
available from many other sources under other names. I'd bet one
of those "other" sources would want a 24hr version.

Most of the Oregon Scientific type stuff (incl the radio-clock)
are available from The Control Company:

http://www.control3.com/

Although their page does not mention a 24 hr mode either.

Cheers,
Paul Grohe

Well now that you have all had your fun while avoiding the question (Possible exception is Boris) I have to tell you that Boris and Spehro are on the right track! Actually these are to be used as coupling resistors for an instrument to measure very large ion charges where the current is almost nonexistent but we need to force the little current to flow through the resistor and not around it (surface). These resistors are available NEW at an outragous price so I thought I would check to see if anyone had a surplus supply. I am told that resistors of this size were used in early electrometers and various lab instruments with tubes back in the 50's and 60's.

In that case I would recommend K&M .

Tel. 413 781-1350 Fax 413 737-0608

It is about 1.5 inches long

Part number is CR1213V1T00K2

I chose it because it had negligible voltage coefficient.
Some resistors from other manufacturer I tested had negative voltage
coefficient and they were rated by manufacturer at 1T Ohm at 10
volts. At 2 V some were hitting 3 T and higher. Can you imagine
trying to zero an amplifier whose feedback resistance is approaching
infinity as the output is approaching zero.

Oh yes, I think I paid about twelve bucks each for K&M.

Regards

Boris Mohar

: No, in some countries they still have a modicum of respect for the
:idea of "personal responsibility." Passing laws that restrict the possession
:of an object is ridiculous. Passing laws against the *illegal use* of
:that object is a bit more meaningful.
:
:- Rich

Like in the USA where it is illegal to be in possesion of a scanner
modified to receive cellular, or to have a scanner in your car?

According to people living there the USA is one of the most restrictive
countries,

Barry

407. Advice on 2M Mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-05 00:00:00 UTC
From: mgarkie@garkie.com
Message-ID: <876027751.3557@dejanews.com>
Source record: 164532

I am a new ham looking for my first radio (a 2M mobile rig). Because of space limitations in my car, I need a radio with a removable faceplate.

I am thinking about either the Yeasu FT-8100R and Kenwood TM-V7A.

I live in the city (Denver) and would like a radio with good intermod performance. I have heard that the Yeasus are excellent in this respect.

If anyone has compared these radios, or if there are others I should consider, I would greatly appreciate your advice.

Thanks in advance!

Mike Garkie

409. Should I get my TS-940 serviced?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-05 00:00:00 UTC
From: Robert Robinson <psykik@idt.net>
Message-ID: <34372489.A6ACD829@idt.net>
Source record: 164534

Greetings,
I am the second owner of a TS-940S/AT that was lovingly used before I recently purchased it. The serial number is in the 7 millions, placing the manufacturing date at 1987.

The former owner is a silent key and I do not know if he ever sent the radio in for interim service and calibration. I have not experienced any overt problems with the radio, at least not yet. I have seen several posts over the years about realigned 940's and I was wondering if this would be a worthwhile or needed service.

If so, could anyone offer any testimonials about authorized service centers for Kenwood?

Thanks,

73 de KB2PSM

I have been looking for a HF transeiver found a TS140S set up for sale. The set includes an MC60A microphone, and a Kenwood PS-30 power supply. The equipment is all in mint condition. The seller wants $625.00 for the 140, $30.00 for the mic, and $90.00 for the power supply. My question is what is the quality of these items and are the prices in line. Thanks.

Check the shootout results in the antenna group first. The Outbacker
was the only antenna worse than a Hamstick (and a hell of a lot more
expensive). A screwdriver antenna, or a big old Bugcatcher, will work
much better.

But to answer your questions, a 3/8-24 threaded stud is a pretty standard
fixture on a HF moble antenna. It is designed to screw into a ball mount,
or the spring some people place between the ball mount and the antenna.
This is the same mount you'll find at Radio Shack for CB use. There are
an assortment of mounts other than ball mounts which also accept a
3/8-14 stud, including *big* magmounts. There are even mounts welded
to a pair of Vice Grips which you can temporarily clamp just about anywhere,
including to a balcony railing.

And finally, as with most any mobile antenna, you will need a tuner if
you want to go outside a very narrow frequency range without getting
out and readjusting the antenna (a screwdriver design is the exception
because it is remotely adjustable).

I bought a maxtrac 300 at a yard sale because it was cheap and at least functional.

It needs computer programming/interfacing to change anything, so in present is just an interesting novelty. Probably is set for some government or inductrial service freq (no counter here).

Any info in how to program this radio or put it to some use in the amateur bands?

Any help appreciated, via post or E-mail.

Mike, ;you are in luck. I would suggest, since you are already
living in the Denver area, to go to Ham Radio Outlet, (8400 E. Iliff
Ave) and take a first hand look at the radios you have mentioned and
others. Talk with the staff and ask all the questions you want.
Take a tape measure along so you can measure the actual radio and see
if it will fit in your car etc. They have several working display
models for people to try. They are a super friendly bunch and I
tend to trust their opions. They also get alot of feedback (pro vs
con) from customers and that should help you tremendously.

Give that a try

Ross

Thanks for reading. I'm listing these items for Mike who is not on e-mail. Please contact him at 315-492-1884 on weekends only or anytime on his pager at 1-800-689-1227.

300 ft. Rohn 45 tower sections in good condition $7.00 per foot.

100 ft. Rohn 25 tower sections in good condition $5.00 per foot.

160 ft. 1 5/8" Hardline with connectors $3.00 per foot.

60ft. to 300 ft. Lengths of 7/8" Foam Hardline with connectors $2.00 per foot.

95 ft. to 500 ft. Lengths of Air Hardline $2.00 per foot.

.75 Meter Satellite Dish with LNB $75.

1 Meter Satellite Dish with LNB $100.

1.2 Meter Satellite Dish with LNB $115.

2 Meter Satellite Dish with LNB $150.

Turnbuckles 1/2" to 1 1/4" $10 to $30.

Prices are negotiable for packages or large tower purchases.

Thanks,

John K2SY

I haven't picked one up yet, but I intend to. I think it is Comet
that makes a 1 3/4 inch SMA antenna that will work on the FT-50. I
spotted it in a recent HRO add in QST. It should sell for around $30.
Even if it is just a little air cooled dummy load, it should work for
repeaters and simplex work that is not too distant.

Have fun,

Bruce Barnes

From: k1bqt@aol.com
Message-ID: <19971005144100.KAA01394@ladder01.news.aol.com>
Source record: 164555

Hi Mike--

>Does anyone know if the optional CW adaptor opens the coverage down to
>7.000, to include the entire CW portion of the band?

Yes, it does. When you engage the adapter, a parallel inductor is switched into the VFO tank which increases VFO frequency (the radio uses subractive mixing, so the VFO has to go up instead of down to hit the low end of the band). Coverage is from 7.000 to slightly above 7.150 MHz. Make sure you get the MFJ-415B adapter that works with both 9440 and 9420 radios. The older 415s only work with the 9420.

Hope this helps.

I'm not sure why this thread has solicited so many derisive comments
rather than a "are you sure" or "how about more details".

The reality is that there are 1 Tohm resistors.

Hy-Meg Corp. in Addison, IL lists thick films up to 4Tohm at 4W.
K&M list a 1Tohm at 2W.
Ohmcraft to 2Tohm.

Why the original poster wants a 1Tohmm 3W carbon, I don't know. Maybe
he has a high temp application in an environment with very poor heat
dissipation, or some strange overdesign requirement. Likely it's
something else since he specifically asked for a carbon resistor, I'm
curious.

Unfortunately I don't think any of those are carbon. Hopefully he will
post additional details to calm the madding crowds and solicit a useful
response.

Scott D. Withrow <with@access.mountain.net> wrote in article
: Wanted, Information on Yaesu 101b, where can I get parts (I live in West
Virginia), technical manual, and other information.

I had to get a manual for my ft101. Yaesu photocopied the original and
charged a small fee. The copy wasn't too good so parts couldn't be
identified easily in the pictures or schematic. I never have bought parts
for this rig so can't help there.

What is interesting is how pervasive Oregon Scientific is throughout
Europe as well as here in the states. I see their products sold
all thru Germany. I believe that Oregon Scientific is the manufacturer
of the weather station that Radio Shack sells. I have seen the same
equipment sold at Hamfests under other brand names. Oregon Scientific
seems to have a presence everywhere.

You night try to see if Yaesu will sell the ant. for the VX-R1. It is
an SMA connector type, about 4" long, and does good in the ham bands. I
bought a Comet SMA 503 thinking it will do better on the VX-R1, but I
have found for for the ham bands they are about the same. (out of the ham
bands is a different story)

This is a decent looking HF amp for 10-80. Looks similar to Collins 30L-1 but uses 2@ 3-500s and is larger. Size of SB 220 (and similar) but more transformer. I have 2 sets of tubes, will sell it with the 8-900 watt set for $399 + shipping or full out put set for $499 plus shipping. Untuned inputs make it easy to load on ALL bands. 73 Murray

The Kenwood 180 is upscale rig, all bands,including warcs. It is solid state and similar to 930 but with DC supply. Really fine for mobile or base rig, with a "superior" reciever by most accounts. Quite a bargain in my humble opinion , at $450 plus shipping. Trades considered always. Will trade UP. Need TS 50,60, etc. Thanks Murray

This 440 S (no tuner) has been mobile and is scuffed up a bit, but not a real rough looking rig. Has a narrow sideband and cw filter, and hand mic. Makes a perfect mobile rig using screwdriver antenna, or good base unit using Large tuner and amp(which I can also supply if you need either). $695 with good operating condition warranty. You pay shipping, and get a fine working rig! Thanks Murrray- As always, Ill trade. Need a TS 50 or other small mobile and also want a "BIG" rig. Thanks Murray

> countries,

Gee, I think I see the brewings of yet another immature "my country is
better than yours" thread. It seems a bit juvenile to me. One would
expect that hams would be the last people to have such a debate since
amateur radio is such an international hobby/service. Doesn't amateur
radio strive to promote international good will?

In response to your statements, I'll inform you that they are
inaccurate. There is no federal law restricting the use of scanners in
a vehicle. There are some *STATE* laws that do, however. In Michigan,
I am perfectly legal in having a scanner in my car since I am a licensed
ham. Even if I wasn't licensed, I could get a permit to equip my
vehicle with a scanner by just filling out a simple form and sending it
to the state police department of communications. I don't see much
point to this law myself, but the restrictions are reasonable for those
with lawful intent.

And to the best of my knowledge, it is perfectly legal to be in
possession of a scanner modified to receive cellular. You simply aren't
allowed to use it to monitor the cellular band.

As for the US being one of the most restrictive countries, I'd say that
sounds like a very biased opinion. Do you base it off of the
misinformation you presented in your post? Actually it sounds like
you've only heard from others that it is restrictive. Where else in the
world have these "others" lived? I can think of many more countries
that were and are more restrictive. I won't mention any names because,
unlike yourself, its not my intention to insult whole nations based on
my personal opinion.

461. mounting Outbacker

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-06 00:00:00 UTC
From: ka9jwx@juno.COM
Message-ID: <19971006.005632.9487.1.KA9JWX@juno.com>
Source record: 164470

Robert N2JTX
3/8-24 threads are used on fiberglass cb antennas & can be
mounted in a ball mount or on one of several adapters available at Radio
Shack. The Radio shack near my house has mounts for mounting a fiberglass
antenna on a side mirror of a truck with the west coast type mirrors.
These have a pipe bent in a u-shape that bolt to the door in two places
with the mirror clamped to the verticle portion of the pipe. These mounts
are designed to clamp onto the upper horizontal portion of the pipe. It
should be no problem useing this arrangment on a railling. These mounts
come with three ways to connect the coax: 1) thread the coax on like you
do on the back of you rig; 2) with 2 spade connectors, 1each for the
center conductor & the braid; 3) with solder connectors, 1 for each the
center conductor & the braid. The later two are used when mounting the
antenna in a hole in sheet metal.
As for mounting the antenna on a window ledge, I picked up an
inovative device some years ago that mounts to the outside frame of the
window useing a compression type fit. It can be either verticle or
horizonatly oriented. A flat piece extends out into the open area away
from the building where a mobile antenna is mounted on the flat piece
like it would be mounted on a car trunk deck or roof.
Maybe you could fashion a clamp arrangement to attach the mount
to the window ledge.
A horizontal run of 1/2 inch conduit in the attic works great
with the mirror mount mention above allowing that there is enough room to
mount the antenna standing straight up.
I can't tell you if a tuner is needed with the Outbacker or not.
Please let me know what you finally use. Good luck.
Paul Webster, KA9JWX

I have the following books for sale from a large collection I recently purchased. I will list more soon but if you have needs, wants for a particular book - let me know.

NOTE: ALL PRICES LISTED INCLUDE SHIPPING - LOWER 48

VHF UHF Manual, Fourth Edition 1985, by GR Jessop, G6JP - Hardcover, excellent shape except for a few pen marks on the front cover. Many projects, PC board negatives. Best book of its kind I've ever seen. $25

Radio Handbook, Nineteenth Edition 1975, by William Orr, W6SAI - Harcover. Cover is a bit torn, otherwise in very good condition. Extensive description of antennas. $20

RCA Transistor Manual - 1966 - Softcover - Cover corner bent, otherwise excellent condition. $8

Radio Shack Transistor Substitution Guide, 1974, softcover $3

Radio Shack Understanding Solid State Electronics, 1972, softcover $3 (needs binding)

GE Transistor Manual, 3rd Edition - 1958, Softcover $10

Transistor Circuits and Applications, 1968, Lawrence Cowles, Hardcover with dustjacket. $12 - excellent condition.

SET of 3 RCA Ham Tips. July-August 1954 (Components for Pi-Coupled Amplifiers), Summer 1962 (A 120 Watt 50 MC Transmitter), July 1968 (An Audio Control System for SSB). These are pamphlets and in good condx - some staining, minor tearing. $8

Principles and Practices of Radio Servicing, 2nd Edition 1943 - HJ Hicks. Hardcover text type book. Very Good condx. $15

ARRL Handbook - 1952 - Cover complete but needs binding. Good condx with a few bent page corners. $20

ARRL Handbook - 1965 - Excellent Condx. inside cover page which has been separated from the binding. $18

ARRL Handbook - 1974 - Very Good condx. Cover a bit worn with minor bends. $12

RCA Transmitting Tubes Technical Manual TT-4 - 1956 - Excellent Shape. Cover has a little wear. Looks like it was never opened. Softcover - $10.

Many more available - particularly for broadcast television.

NOTE: Satisfaction Guaranteed. You don't like it, send the book back I'll refund the purchase price minus the cost of shipping.

ALSO: 10% Discount for current FISTS, QCWA and OOTC Members. Only one 10% discount applies. Buy several books and we'll talk about price.

I've been caught this way with precision resistors in demanding
applications. You specify a resistor in a TO-220 package in order
to minimise self-heating and thermocouple voltages, and some clown
says "why are we buying a 10W package for a part that will never
dissipate more than 150mW?".

Of course, if they do it in a meeting, you should be awarded the
ears and the tail every time....

470. High Power Antenna Tuners ??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-06 00:00:00 UTC
From: Michael Melland <badger@vbe.com>
Message-ID: <3439202D.43C8@vbe.com>
Source record: 164479

I was re-reading the MArch QST test of several high power antenna tuners. I was always under the impression that the Nye-Viking MB-V (MB-IV too) was one of the top tuners available. From the article I am wondering if this is so ?? I am thinking of purchasing one (MB-IV) but thought I'd solicit some additional opinions from the masses <grin>.

What experiences negative or positive have you had with Nye-Viking or any other high end tuners ? What legal limit tuner do you recomend, past or present ?

Thanks, 73 de Mike KB9QHU

From: Jim <jstrohm@taxes.net>
Message-ID: <3438BDBC.6739@taxes.net>
Source record: 164481

The HF9VX and its predecessor(s) are somewhat narrow-banded
on 80 meters, and 80 meter tuning has some effect on 40 meters.
You need to choose a section of 80 meters where you want
to hang out -- SWR will be higher at band edges, and may
cause a solid-state transmitter to reduce power.

I have worked 49 of 50 U.S. states on an HF6VX (has the same 40/80
sections as the HF9VX) on 80 meters, and hold WAS 40 Phone with this
antenna, with most contacts at 100 watts or below. This is an
excellent antenna for limited space, and I feel provides very good
performance on 40 and 80.

Hi Robert
Have you noticed any indication which leads you to believe that this
radio needs alingment? I have a 940 for 8 years and never had any
problem with it. It's a fine radio and you will talk to the same people
with a new $4500 radio as you would with any old one. It's true about
parts becoming a bit rare, however there where many made so there will
always be parts. Enjoy it! And remember "If it ain't broken, don't fix
it." 73 Chris VE3NGW/W4 Florida

475. Need help withKenwood TS-790A

Newsgroup: rec.radio.amateur.equipment

Message-ID: <01bcd2a0$d09a3a60$bb4637a6@ibm-customer>
Source record: 164490
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Just got the Icom 706 Mark II and the AT-180 Antenna tuner - here's my challenge...

Ideally I would like 1 wire antenna, coax fed to work the following frequencies:

3269, 3350, 80M/75M, 4005, 4015, 5157, 7311, 7372, 7382, 9960, 30M, 10255, 13975, 20M, 14933, 17M, 15M, 12M, 10M, 6M.

The specs on the tuner are:
Matching Impedance: 16.7-125 Ohms HF 20-125 Ohms 6M

Am I dreaming here that I can design a wire antenna that will couple via the tuner at these above freqs - as you can probably tell I'm a MARS op and was told by Icom and HRO that the tuner would handle Mars freqs and anything else in the HF range - not happening that way.

Can someone with one of those programs possibly help me out with a design.

or should I go back and get the SGC 231 tune everything tuner and put it outside at the end of a very long wire?

Any other options? I would go to 2 antennas if necessary.

Right now I've got 2 G5RV's up and running - would trimming those to specific lengths be a strategy?

Any help would be most appreciated.

Before you buy equipment in a foreign country, be sure that
you can legally import the equipment to your home country.

Also check on import duties _in your country_. The gentlemen
in Hong Kong will gladly tell you that there are no import
or export duties, if it helps them make a sale.

You gotta be NUTS!!!!! You want to trade your 2510 ($50.at most resale
value after modified!) for a 2m ht or rip someone off for $200.00?!?!

This is rec.radio..swap, not rec.radio ripoffs!!

Wake up to reality!!

Get a life!!

I have had inqueries as to the
range so I swept this duplexier
again and found:

Who would have thought. This thing tunes flawlessly
from below 420 to above 470. Just as much rejection
and Q at both ends of the range.

Thanks, Dan.

I personally use a Ten-Tec Omni C and have no complaints (well maybe it is
a bit fussy about antennas and SWR match). For a basic, no frills rig that
is easy to use I find it a great little radio. I have used it at club field
day sites and for the Canadian Winter Contest with new hams at the controls
with no ill effects from the rig or operator hi.

Good luck in your search for a new rig.

Hi and thanks for reading this posting,

I have recently taken over the programming for our club repeater and I am experiencing a few difficulties. I have tried to contact CAT over the Internet at their web page but it comes back URL not found. I have tried their telephone # but it is no longer in service. I am now wondering if the company has gone "belly-up" hi.

If anyone has a valid URL or telephone # I would appreciate it, failing that if anyone is currently using a CAT-300 and is familiar with the programming maybe you can give me some pointers.

Thanks and 73 de Larry VE3YET.

Hello Bob.

Well, you can tune even a water pipe as long as it is not plastic but it will not
work as you expected.

To say in another way you are not able to make a good antenna with these requirments.
Even if somebody help you with a design it will be only a compromise. You have to decide
what you want, you can get it all !!!!

Advice...
Choose only a few freq. and make a multi-dipole to see how ity work.

From: hi3pgj@codetel.net.do
Message-ID: <MPG.ea40bda15db270e989680@news.codetel.net.do>
Source record: 164318

Let me explain my question.
I'm interested in a software that makes the computer with
a modem an a radio, to run like an Autopatch.
When an imcoming call from the remote radio it's made, the computer
pick the phoneline after the code it's enter , ect.

Or when an incoming phone call it's made the computer will ptt the
radio and will ring the remote radio(if it's in ring mode).

Most of us have a computer, a phone line, and a radio.I think this will
be very interesting.
Does someone had a better idea?

I need a set of extender cards to do some work on a TR7.

I get no audio in any mode other than AM. Looks like a problem
on the PBT/reference board, as I see no BFO or AM reinsertion output
from that board. Any hints would be welcome.

If there's anyone in the New Haven area who has worked
on a TR7 and has some free time, I'd willingly accept
some help.

Thanks.

Hi all:

We have a customer in Nigeria who is seeking information on Magnus Electronics, formerly located in Chicago, IL. Magnus, for a number of years, was the exclusive foreign distributor for Ten-Tec amateur radio equipment but we stopped using them for this a number of years ago and have had no contact with them since at least 1990. Magnus either manufactured or had "private-labeled" a number of crystal controlled HF transceivers that the gentleman in Nigeria is trying to obtain schematics and service information for but we have been unable to locate any info. The last phone number and address we have is 3500 Devon Ave., Chicago, IL 60659, (312) 679-6070. This phone number comes back as disconnected and Chicago directory assistance has no listing. Our customer in Nigeria "thinks" they have moved a couple of times in recent years but has nothing to back that thought up.

If you have service information for Magnus, or can provide any contact information, we would be glad to have it to pass along to them. As you can imagine it's a little tough to try to do this from Nigeria! Please reply to <sales@tentec.com>

Hello !
For the first time I saw a Drake L-7 Linear Amp, and I loved it !
It was on a Ham Radio Fair, but I thought they were asking too
much for it (and that was the opinion of everyone so the guy
didn't sold it !!).
My question is, how much is it worth a L-7 , with almost new
tubes. Also I wasn't sure it worked 10m band, does it or not ?
Thanks in advanced for any answers !

Bob, you could try a large discone, or a biconic antenna (but I do mean large in order to cover the bottom part of your required frequency range). Or you might try a fishbone design worked against a counterpoise screen.

Either of these antennas will take up a lot of real estate. Another option is a resistively loaded antenna. Efficiency won't be great, but you can get a VSWR within your tuner's limits across the entire range. The military uses these for FH systems on HF.

You can also try a distributed capacitive loading scheme (one such was documented in a recent Communications Quarterly article). This can give you increased bandwdth and smaller size. Either approach can give good VSWR bandwidth at some sacrifice in efficiency. If you can tolerate performance 3 to 6 db (maybe more) worse than a dipole, one of these options may do the trick.

It'll be lots easier with two antennas. One for 10 MHz and up, and the second a random long wire for the lower frequencies. The AT180 may need some help from external reactances to cover all the lower frequency range, IE a switched L network.

>there is some real reason to limit yourself to VHF you should go for the HF
>license and the HF radio.

While there is certainly nothing wrong with gaining HF privileges, for
many people it is not "most of the fun" (though for some it is). There
is a lifetime's worth of stuff you can do on VHF+ which is exciting,
challenging, and fun. After all, 99% of amateur spectrum is at VHF+,
and there are satellites to work, ATV to run, high speed data systems
to build, etc. Unless "shooting skip" in a congested and competitive
environment is your thing, you may not find much of interest at HF
(though there are some interesting things going on at HF, mostly
hidden under those grotesque pileups and other bad boy "CBers with
an attitude" activities that fill too much of HF).

>Also, when you get the radio you can just make up any old call sign to get
>yourself on the air to test your fun new radio and get your feet wet. Most
>people won't tell you things like that but if you stick to the right
>frequencies and don't get stupid about it (doing it only several times) you
>can give yourself some motivation to get the license and really get into it.

And here's a prime example of the sort of CBer with an attitude behavior
I'm talking about. Don't get started off on the wrong foot by being a law
breaker. Play by the rules. You'll have more respect for yourself, as well
as gaining the respect of others, if you do. You likely won't get caught,
but you'll know you did something wrong. And that's not a good way
to start out in *anything* in life.

From: STEVEN L UMBACH <N9ROU@prodigy.net>
Message-ID: <01bcd35e$050484a0$4d85edcc@default>
Source record: 164386

Hi JIm. I looked at both rigs and spent a little more money and bought a FT1000MP which I have never regretted. The TS870 has far more dsp features than the IC756. With the TS870 you have the abiltiy to digitally adjust the passband width at the if stage - hence the reason Kenwood arguably felt there was no need for optional filters. The Icom 756 can not adjust the passband digitally - it only has old fashioned passband/slope tuning. The DSP on receive in the Icom IC756 is used for noise reduction and notch filtering - again not passband shaping. Just thought you might want to know. Good luck in getting a new rig.

I am having a tough time deciding which transceiver to buy: a Kenwood TS-870S as opposed to an ICOM 756.
My first interest is having digital signal processing at the IF stage. Both seem to have this feature.
Which radio offers the best bang for the buck, is the most dependible and will last the longest without problems?

I frequently see the TS-870's for sale on the internet but not the IC-756's. Why is this?

I would like to hear from 870 and 756 owners to get their opinions on these two tranceivers.

Thank you

>bands is a different story)

I haven't been able to see any improvement on 70 cm between the stock
VX-1R antenna and the Comet SMA-3, though as you note, outside the ham
band is a different story. It is a bit better on 2m, though. So the VX-1R
antenna will probably do as a smaller substitute for the FT-50R antenna.
The antenna for the Standard C508A is another contender. It is also small,
and works well inside the ham bands.

But if you want the antenna to serve over the wide range of frequencies
where the FT-50R doubles as a scanner, neither of these antennas is a
good choice. The bigger Comet SMA-3 is the hands down winner for
that.

Hello,

I'm trying to create a setup that can broadcast a UHF TV signal to my house and each of the houses that is adjacent to my house.I have already made myself a UHF transmitter which broadcasts in the CH 30-CH 40 range and I've tested it on a VERY short range (20 feet) basis. My question is this...

Can I connect one of those signal amps that you Radio-Types use for amplifying your radio transmissions? If so, where I can get an inexpensive - LOW POWERED (I don't want to create a signal that will get me into trouble) amplifier? What will I need to do antenna-wise? Any other suggestions?

I'm not doing this to setup any perm. station - this is simple a hobby thing - I have years of experience with computers and computer electronics, but I'm afraid that I'm a simpleton as far as broadcasting is concerned.

Any help is appreciated, please email me as I don't check this group very often.

Blackrobe

Source record: 164399

I agree that is is important to learn the correct cadence. But I think it would be better learned by first using the iambic keyer. This way all the cadence that you hear is correct, and then as you change to the straight key sending code with correct cadence will come naturally.

I also went to extremes looking over the 2 radios. For 3 weeks
i was at the Candy store matching and trying both radios.

All in all thay both had nice features but in a long run , i liked the 756
recever
and the little extra's it had... I think you will be pleased with the 756
as
a am ..

Cuts throu all i want on all bands without filters..

Good luck in what you decide..

I bought one precisely for the same reasons. I am VE3JSJ in Canada and
G4RDG in UK. The VX-1R can be programed for 1750 tone burst (described
in the manual), and the shift can be set to whatever you want!

552. FS: Scanner/Motorola/Yaesu

I am currently out of work and am forced to sell some stuff to pay
bills. Here is my list. All equipment works 100% and is in either
brand new condition or dam close. Prices are firm and you pay shipping.

Radio Shack PRO-62 with brand new NiCad rechargable
batteries, antenna & AC wall charger/adapter. This hand held scanner
receives:
30-50, 118-174, 380-512, 806-823.9875, 849.0125-868.9875, 894.0125-960
this radio has not been modified. It is in excellent condition and has
only been used indoors as a base scanner. 8 months old paid $299+6%
sales tax.
FS: @ $175

Motorola SP-50 Hand Held UHF 2Channel - with 1 battery, antenna & drop
in rapid charger with slow charge option. This radio is in brand new
condition
and is less than 4 months old. It is currently programmed for 2
channels in the 460Mhz band. I paid $389+$49 for the rapid charger.
FS: @ $275

Yaesu FT8500 2M/70CM Mobile w/Deluxe Microphone - Yaesu
programming software, programming cable, Mars/Cap mod, tone decode board
installed, attractive microphone stand, box and all literature.
You don't even want to know what I paid for this (Way too much!)
FS: @ $590

555. Re: FT-50 as a mobile?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-07 00:00:00 UTC
From: Andrew Rosengarten <andrew@tropicom.net>
Message-ID: <343B0DB9.112FDDBF@tropicom.net>
Source record: 164407

I use my FT-50 in my Toyota 4 Runners pull out drink holder. It fits perfect and works great for an 800mhz scanner. Also you may want to order the high tention spring clip for the Yaesu Vertex commercial radio. It fits the FT-50 and is very much like a Motorola belt clip. Strong, Sturdy and very Springy. You may be able to spring clip it to your dash, ashtray, drink holder etc. Oh and by the way, Icom makes an SMA antenna exactly 3 3/4" long that fits perfect (Icom FA-S270A) it does not work quite as well as the factory antenna, but is much more portable and 100 times better than the small SMA commet. The SMA-3 antenna by commet is by far the best antenna for that radio period! Just too long. Good luck all.

POSTED AND MAILED
For automotive use I have the Yaesu one-ear head set, boom mike, and VOX. I put the speaker over my right ear so I can still clearly hear external sounds. I put the microphone close enough to my lips that I can stick my tongue way out and lick it (not very tasty, but you get the idea). If I set the VOX gain all the way down, I can drive with

Marc and all...

I'm glad to see this thread abt the 50r for mobile use as I JUST bought a used one.

I've been out of ham radio many years... didn't have ny equip till last week when I bought the 50r. Things have changed and I'm like a kid in a candy store!

Tell me... how do you mount or set the 50r in your vehicle??

I would like some kind of bracket that would allow me to hold it upright in my car. Then I would use the above headset for operating.

IOW... the ideal bracket would hold it for use as a mobile but allow me to slip it out and use it as a handheld easily. Sort of like how police use their HT's in their cars.

I realize that an external antenna on the car is best..... but for now I would use the 50r stock duckie. Actually... this "ideal" bracket would have a connector for an external antenna.

Any ideas or advice on the above... anyone?

Message-ID: <61gre1$6q1@bgtnsc02.worldnet.att.net>
Source record: 164262

Anyone remember the KDK FM-2016A 2m xcvr? I've got one (around here somewhere, buried under junk in the shack) but it won't transmit any more. When keyed it appears to try to key up (the TX light comes on) then it quits (TX light goes out, display blinks ONCE then stays on), and of course no outgoing signal. This is not the behavior the manual says should happen if the PLL fails to lock (which says the display should keep blinking) but I think it is either the PLL failing to lock or the PLL saying it failed to lock.

If someone recognizes this problem and knows a reasonable fix, please let me know.

..I remember an article appearing in the now-defunct 'HamBrew' magazine on just this subject. It pointed out the legal requirements (although maybe not in such detail) but also described how to construct an FM station from a kit offered by Ramsey Electronics. I will look for it and pass along the information if I can find it.

Less desirable for whom? If someone wants to xmit out-of-band, let
them do so legally with a radio designed for those frequencies (assuming
they're licensed to xmit on such frequencies).

>The HTX-100 is a REAL nice radio and is a bargain -- but without
>FM and CB-ability (AM, LSB) like the Uniden, it's less desirable.

Less desirable because it doesn't have "CB-ability"? I'll bet you cheat
on your income taxes, too...

Jim I can't agree with you more. As a consumer, I appreciate the choices we have in the HAM gear marketplace. I wish you luck in your future purchases.

Could you elaborate more as to why the 1000MP is not even on your wish list? Sorry it is off the topic but I can't help to ask such a silly question.

Best 73!

> which YOU KNOW WILL PROHIBIT YOUR DOING THIS.

Common decency to check out FCC regulations? What do you think I'm doing by posting this message to the newsgroup? I told you that I have ABSOLUTELY no experience in broadcasting signals. I'm a computer/electrical engineer with a natural bent towards curiosity and I just happened to have built a UHF transmitter... is there anything wrong with that? Is there anything wrong with appealing to this group of professionals and experienced amateurs for their supposedly "benneficent" help?

Don't get me wrong... I don't want to start a flame war. I don't want to hurt anybody's feelings or ego... I was just looking for INNOCENT information and I get 28 people jumping down my throat with threats detailing how they plan to turn my name into the FCC and get me arrested.... SHEESH... give it a rest. If I had known how unfriendly this newsgroup was going to be to newbies I would never have posted. --- (sigh)-- Now on to more useful things...

> Why don't you just connect a cable from your transmitter to the
> receivers in question and avoid the possibility of Federal
> prosecution?

-1) A cable isn't very practical... the houses do not have conduit running between each other and I hate digging trenches.
-2) Is there any way to "tight-beam" a UHF signal to particular antennas?
-3) Would this be allowed by the FCC?
-4) Is there any frequency that I could use other than the UHF bands?

Many Thanks,
Blackrobe

If the '580 is like the '940, the audio on pin 11 is active only if the ptt is switched through the same din connector. This will mute the front panel mic jack with audio is switched in from the rear. Are you keying the rig using the ptt line on the 13-pin din connector?

I agree, for some, that method might be better. Maybe even for most people. I learned code myself too and was able to pick up the correct cadence very well from using an Iambic paddle from when I first used it. I now use both a straight key and an iambic. It just seems hard for me to understand how you would get any kind of feel for how the code is really supposed to sound if you are using a straight key. I feel that I send very good code, which is irrelevant, except that I apparently learned opposite from the way the "experts" say. I respect both of your opinions, and, I guess, for a lot of people you are probably right. However, I think the "Iambic first" method will also work for many other people besides me.

Also, in my practicing to get up to 20 wpm a couple of years ago. I spent quite a bit of time on a qso simulator on the pc. I used a both a straight key and an iambic keyer. This is a very good way to get closer to technically perfect code as the computer is very picky about your code. At least mine was. Maybe they have more forgiving software now, but that "pickieness" helped me. Whad does anyone think about that? Anyone else use these sims on the computer?

I have a portable Uniden Communication Receiver CR-2021. This receives 150khz-30mhz AM/FM/SSB/CW with a narrow & wide filter. This radio is digital with digital memories. It is in average condition and works well. It is missing the battery compartment cover in the back, the Light on the display cannot be turned off, and the internal speaker does not work, but if you plug in headphones or an external speaker it works fine. It has 6 memories in each mode and I have the original manual. The DOM was 1984.

I bought this from a friend of mine who was selling a recently deceased ham's shack. This would be great for anyone who wants a beginer or a spare Shortwave radio receiver. Its all black plastic with a working antenna and has a nice carry handle with AC power cord and can be powered by DC.

I thought that for $30 it was worth while to see what SW was all about. I decided that SW is not for me and my wife does not like the long antenna that I strung through the house. I had my 3 months of listening fun and now I'm done.

To anyone interested the price stands at $30 + shipping.

If you want any other information on it please email me directly andrew@tropicom.net

And, in case you are concerned about receiving the WWV signal, the time calculations displayed on a GPS receiver are actually transmitted from the individual GPS satellites, each of which carries two atomic clocks (one "high precision" and one "medium precision". Not WWV, but still VERY accurate. In fact, the accuracy of the transmitted time signal is one of the key factors in the receiver determining the accuracy of your position.

590. AM-FM Radio Antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-08 00:00:00 UTC
From: "Gale M. Simmons" <gales@lightspeed.net>
Message-ID: <01bcd379$191f0c60$12f671cf@default>
Source record: 164322

I would like to install one or more antennas which would improve my home radio reception, both FM and AM. I live in the southern end of the San Joaquin Valley in California. I would like to listen to AM stations which are located north of me and AM stations from Los Angeles which is located 100 miles south. Also, their is a mountain range (6,000' to 8,000' elevation) lying between Los Angeles and my location.

Since I know nothing about this subject, can someone tell me what type of antenna I should be looking for or where I could find detailed plans for such antennas?

Any help or information you could give would be greatly appreciated.

Thank You!

Gale Simmons

Hiya,

The length of this thread indicates that there is now a viable alternative

to posting flame bait like "Motorola & Macs suck long live INTEL" on

alt.comp.ppc groups.

A single "I need a large value resistor" post can generate hours and hours

of reading.

I'll have to keep this one on file for when things get quiet.

Regards,
andrewm at quicknet dot com dot au

592. Repeater Tone Panel

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-08 00:00:00 UTC
From: Gary Sanders <gsanders@gte.net>
Message-ID: <61errl$pu6$1@gte1.gte.net>
Source record: 164324

I'm still looking for information on a model CSI-22
repeater tone panel, made by:

Communications Systems Incorporated.

The company is still in business, but they don't have any
info they are willing to provide.

I need connection and programming information, and a
schematic, or I'd be willing to pay a reasonable fee for a
manual or a copy.

The CSI-32 is similar, and I could also use it.

Please respond via email.

Thanks,

Gary

Sorry Gentlemen, but for some reason I can't see the original post, so I will try jumping in here.

Very often I see indications that someone cannot tune this or that antenna with the tuner that they are using.

My own experience with dipoles, long wire antennas, G5RV, Center Fed Zepp Antennas, Verticals, etc., is that I can tune anything you've got if I have the MFJ-989C Tuner. I have had pretty good luck with other tuners as well, but they HAVE TO HAVE A ROLLER INDUCTOR, and you have to have to follow a procedure..

I have written a pamphlet on this subject, but I won't try to put all that in here.

Procedure is everything. If you expect to be able to tune an antenna by just twisting the knobs through their range, you'll be disappointed. In rare cases you may even have to add a few feet of coax to a feedline to get away from a challenging impedance.

Rule #1 - Don't try to vary all three controls at once - go through the range of Transmitter Capacitor and Inductor while the Load capacitor is fixed at maximum capacitance. Only after that is exhausted unsuccessfully do you reverse and vary the Load capacitor and inductance while keeping the transmitter capacitance fixed at maximum.

Rule #2 - Expect the controls to be highly interactive. Go back and forth between the controls until you finally get down to 1:1.

Rule #3 - When you are tuning a control through a dip, always go through the dip to just BEYOND the minimum and then switch to the other control - back and forth with the two controls until you get a sharp dip. You will find that you sometimes have to SLIDE the two controls together into a dip.

Rule #4 - Practice by tuning up with a dummy load instead of the antenna. Log the settings for each frequency. Use these logged settings as the starting point for that frequency when you are working with the antenna. When you finally get the settings for a given frequency, be sure to log them.

Rule #5 - Don't give up - A G5RV CAN EVEN BE TUNED TO THE 30M BAND.
I've done it with every G5RV that I've had.

>or the gain is too high, as there is a terrible echo on the signal.
>There are no internal controls in the mic. Any ideas?

An echo is totally inexplicable - no matter what your problem. RF in
the microphone cabling usually manifests itself with a white noise
type of whooshing noise that overrides you speech OR as a low
frequency oscillation of the whoop, whoop, whoop type at a period of
less than 1/2 second.

Try putting some ferrit beads on the Microphone cable and also change
to a balanced antenna, if you are using a vertical or long wire.

Message-ID: <61f2u8$a6d$1@newshost.cyberramp.net>
Source record: 164329

Hi all,
From the input I've gotten from my article in
rec.radio.amateur.equipment and in yaesu@contesting.com reflector it
appears that:

The VX-1R was sold in firmware revisions A100, A101, A102, and A105.
A103 and A104 were skipped. The only version that supports crossband
(recieve on one band and xmit on another) is A105. If there is a later
version than A105, I haven't heard of it.
If any one has any info other than this, please let me know.

Hope this helps,
Jim McGhee N5FZT

There is a device called a "Select-a-tenna" manufactured by
Intensitronics Corp. P.O. Box 562, Hales Corners, Wisc. 53130. You can
simply set this device next to almost any AM radio, no wires, no plug in,
no batteries, tune it to the AM frequency you want and the signal is
amplified about 5 or 6 times. This device is somewhat odd in appearance.
It is a round disc shaped unit, about 12" in diatmeter and about 2-3"
thick and it sits upright. You just set it next to your AM radio, tune
it to the frequency and you will hear stations you couldn't even pick up,
just like they are local. I have one and it works. I have seen them
advertised in various mail order houses such as Herrington and perhaps
Sharper Image. They cost around $60.

Andy

Message-ID: <1997Oct8.091520.1@evax02.d51.lilly.com>
Source record: 164340

Being a veteran of the NOVICE license (a LONG time ago) we had straight keys and the option of other straight keys or bugs. We developed our CW skills on the air, one contact at a time. It was annoying to work a person trying to use a bug (and later folks trying to use a keyer) rather than a person making an honest concentrated effort with a straight key. Sure, some fists sounded like crap... but they sent only the number of dits they needed to send. And the use of a straight key reduced the urge to try to send 30 WPM when receive ability was 10 WPM.

Eventually we increased sending and receiving ability to the point that it was a PLEASURE to listen to the 13 wpm tape at the FCC office, sent with perfect spacing and cadence.

Most of us have graduated to keyers, some to iambic (squeeze) keyers. And occasionally an extra dit gets in there. Learn the code first, send only as fast as your brain can talk to your hand... then learn the keyer later.

And practice ON THE AIR... the extra QRN, QRM, QSB etc will make you a better operator.

For good intermod performance and removability, you might consider these
alternative strategies:

1. Old Gear
For City use, I'm quite fond of my 70's vintage Midland 2m mobile.
It has helical cans built in. When I'm on the flyover ramp on our
"Southeast Distressway" next to the police dispatch tower in site of
downtown Pager-land -- Intermod alley -- it's clear, while the scanner
goes crazy. It doesn't have all the bells and whistles -- its memories
are in my head; although it's digital frequency entry to control the
pll, they're dialed in not keypad; Tones were added onto it
aftermarket, I need to bring that control out to the front panel
someday -- it is made of discrete parts assembled into a rational
block-diagram that I'd have a hope of repairing. And it was pretty
reasonably priced at the hamfest too. I forget if I paid a hundred or
a buck-and-a-half. Once I get it's grounding and isolation right, I'll
be able to run 25W with it, but currently 5W into NMO 5/8 on a metal
truck roof has all the range I need. I take it in the house at night
and park it under the seat during the day, since I know the hard-way my
driveway is high crime.

2. RS HTX-202 + Amp/PreAmp with helical cans

The HTX-202 has NO extended recieve; it's very tight front end is
almost intermod proof by itself.

The better mobile-amps are equiped with helical filters (mini-cans)
that protect their preamps from the pagers (and also keep the Amp
clean). These should protect less tight HTs from intermod, but
with the HTX-202, nothing. Or you could get an amp with
straight-through receive for the 202. (Heck, just hooking the HTX-202 to
13.8V and an external antenna give you 5W mobile, provided you leave the
belt-clip heat-sink in place -- that's enough for city work.)

Combining an HT and an underdash amp, you get the equivalent of
removable face/control with the added advantage that the removable
component is usable separately.

MAHA has an Amp that includes support for HT and
powersupply mating etc, might be interesting. Not sure if it's rigged

for 13.8V or not.

From: Paul Anderson <p.e.anderson@lucent.com>
Message-ID: <343BA2AE.FB5@lucent.com>
Source record: 164343

FOR SALE: ICOM IC-820H VHF/UHF all mode rig with SM6 mic,
EX-1514 vox unit, Yaesu YS-500 VHF/UHF swr/power
meter, Cushcraft 2 meter 4 element beam,
Cushcraft 70 cm 5 element beam.

Package deal $1200

All equipment was purchased new in August of 1996...all in brand
new condition. The 820 has literally done nothing but sit on my
desk and look pretty, its been turned on and used maybe a dozen
times at most. The Yaesu meter was used to test the SWR on the
two antennas right after I put them up...it has done nothing
since. I bought the equipment thinking that I'd get a little
more active in VHF/UHF operating...but...it ain't happening...
so...

Jim,

Although I might not be able to provide any input to your decision, it might just be the place for me to BS for a while. I have played extensively on both of the rigs at the candy store and came to find out that I like the FT-1000MP the best. This is why I don't have any HF rig, yet!

It is strange that I set out for the price range between $2000 to $2300 and end up going to go for a $2700 radio (my wife is very mad at me on this). Yes both the IC-756 and the TS-870 are very, very nice rigs and there are pros and cons about the DSP implementations and other features such as CW dot chopping and AM filtering on the IC-756, and the so-called "Blow-By" on the TS-870. I guess I should let other people to comment on these open issues. My basic arguments are as followed:

If I want to be active on 6M as well, why would I need the TS-870? I debated on the question the most. I don't know if I would ever be active on 6M at all! If I would be active on 6M, I think I would pick the IC-756 in a heartbeat. Simply due to the sporadic nature of the 6M band and a spectrum display will be a giant help. My life style suggests that I need more time spent with my kid more so than waiting for the band to open. So 6M is out of the picture for me.

OK. I must admit that I might be active on 6M someday. I believe that I would need a backup rig, too! Something like the TS-570D, FT-920, or IC-706 should fit the budget. By the time I really need that "Wideband" coverage, the IC-746 will come along and it is supposed to be about the same price as the FT-920. Hey! I am in no hurry on a good "Wideband" rig! IMHO, ICOM shouldn't have let me know about their "next 756". hehe... It might not be a replacement to the 756, but it's bad enough that I know I have a choice now if I wait long enough.

That's why I want to concentrate my muscle on HF. There is no way I can affort the IC-775DSP or the FT-1000D unless the bonus check is much much bigger! The TS-950SD? I don't know how they can get rid of the inventory if they don't lower the price. hehe... Sorry for those of you who have the TS-950. Hi Hi. The TS-870 is at the $2300 range, but why sattle with that when the FT-1000MP is just $350 more? I have done all my homework in search of a good HF rig and I think the FT-1000MP is the best for me. I can pop all the filters in gradually so it is not too conspicuous to my wife's hawk eyes on our spendings ;)

It seems to me that many people are dumping their TS-870 in the swap NG. I don't have the specific explanation as to say why, but it suggests to me that some people are beginning to look for alternatives for their

operating needs. May it be the 6M coverage and the spectrum scope? I don't know. If they like the TS-870's IF-DSP implementation, why getting rid of it? I also don't know the answer. But I have used the FT-1000MP and I feel it's batter for me over the TS-870.

Good luck to you on your big decision! Let us know what you are going to get!

Best 73!

This is a beautiful HF rig for either a novice or experienced ham looking for a radio that works excellently as either a mobile or shack rig. This radio has had very little use, and has the XF110C 500hrz CW filter installed. Will include a second power cable, so you can set it up for both the house and mobile. Comes with the YSK-900 seperation kit as well. Asking $1100.00, and may consider throwing in a Bencher Low Pass Filter. Direct inquiries to:
Lobokop@aol.com
or
rmoeller@ntsource.com

also for sale: Yaesu FT-8500/MH-39 dual band VHF/UHF radio, like new in original box.. This is an exceptional mobile or shack radio, and easy to master the operation of all the features using just the microphone. Very little use.. asking $500.00.

Kantronics KAM Plus Version 8.0 Eprom... this is a great All mode digital controller and I'll include Hostmaster II+... asking $250.00

Paul,

You will not be able to receive on one VHF frequency while transmitting
on another, since the radio attenuates or blocks the remaining receiver
when transmitting on the other side (in V+V or U+U).

I've never had a problem *transmitting* in V+V or U+U, no matter what
frequencies I've used. I'll try your test today...

Hi Blackrobe,

Us "radio types", as you put it (at least this one), take offense at
your audacity. We have worked hard to attain the necessary licenses
and expertise to do what we do legally and professionally, and you
don't even have the common decency to check out the FCC regulations,
which YOU KNOW WILL PROHIBIT YOUR DOING THIS.

Why don't you just connect a cable from your transmitter to the
receivers in question and avoid the possibility of Federal
prosecution?

PMJI but I have a Yeasu FT101Z, basically the same piece of kit, and the output power (from memory) measured by Peter Hart in RadCom May 1982 was ca. 100W PEP, dropping off a bit on the 10m band. In my user manual the thing is rated for 180W input power, but as the tubes (2 x 6146B) are AB1 biased assuming an overall efficiency of 50% would give an output of ca. 100W.

I wonder how Bob KI8AB was measuring the output (dummy load with a rectifier diode?), if so then this would give the V(pk) and the fmla to give pwr output would be P = V(pk)^2/(2 x 50Ohms) which brings the output closer to the expected result. I know *I've* made mistakes on this before :-)

As for the low power reading of the tuner meter, I don't know how the matching to the antenna is done, maybe the tuner coil is rather lossy?

They are usually seen for around $800-900US. Yes, they cover 10M, but unless you need the WARC bands, in my opintion the L-4B is a better amp. A good L-4B goes for around $600-700US.

Good luck.

I've had one for about 8 months. I'm pretty happy with it, overall. I use it quite a bit hiking and backcountry skiing and it's about as rugged as you're going to find in Amatuer gear. It's not as tough as commercial gear, but it is VERY feature rich. Some might argue maybe too much so. Overall, though, the features (including very broadbanded recieve), rugged contruction, size and price make it very popular. It gets my vote.

630. Re: KS870s vs IC756

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-09 00:00:00 UTC
From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <343CE3E5.C51F4453@ix.netcom.com>
Source record: 164212

I'd go with the ICOM.

The TS-870S does not have provisions for adding non-DSP filters (xtal or mech) in the RF-level IF stages. Big disadvantage for CW.

I do see used IC-756's for sale. Look in rec.radio.swap

Phil

p.s. -- I have a TS-570D. AF stage DSP; BUT it does let me add a 500 Hz cw filter, a major plus over the (more expensive) 870S.

PRESS RELEASE - Re: HAM LOG 3.1 by Robin Gandevia VK2VN

Many users have advised me that the program Ham Log is so well written and easily understood, that quite often the manual is not used. This is because the program is so simple and intuitive to operate. Further, if a user has a query about some aspect of the program, the extensive context sensitive help available throughout the program (F1) is usually more than sufficient.

So we now have the new "Environmentally Friendly" version of Ham Log. This version includes a copy of the manual on disk so that it can be referred to if needed, and can of course be printed.

And the best news is that the environmentally friendly version will be more 30% less than the normal version. Furthermore, the package and post charges have been reduced to NIL for Australasia and just $2 for the rest of the world. This saving also will be appreciated by many from non English speaking countries.

Now, thanks to Richanrd Murmane, VK2SKY, the latest demonstration version of Ham Log 3 is available on the Internet at the following address:

http://www.zeta.org.au/~richardm/hamlog.html

This also includes links to the VK2 home page of the W.I.A. (Wireless Institute of Australia - the oldest such body in the world).

Ham Log 3.1 is also available for you to download at

ftp.funet.fi (look in the /pub/ham area) courtesy of Markku OH2BQZ

or, by courtesy of Ed Robbins VE4YE at

http://www.mbnet.mb.ca/~erobbins

Yours sincerely,

Robin Gandevia VK2VN

As far as I know HAM radio is exempted.
I am in favor of any bill that blocks the monitoring of "private
conversations". HAM radio is not "private communications" ...
HAM radio is on the public airwaves and can be heard by anyone with a
radio that can tune the ham bands. Hams at my ham clubs are in favor
of this bill's idea (I have not seen the actual bill ... just heard it
talked about at our club meetings).

W4SCO

I am also a private pilot and communications on the aviation bands is
also not "private" so it should not be affected either.

I am looking for the specs for an Amperex E55L/8233. Would like to see curves and words describing intended use...anything better than the back of the ARRL manuals.
Also, I need the schematic/manual, a copy is just fine, for a Hickok Model 539C (Tannenbaum only has the A, and neither of us knows the difference).
If you can be of any help, thanks.

I have to agree exactly. Clif talked me through repair of the tuning
knob encoder on a TS930 - he got no $$ out of it, and saved my friend a
big repair $$, and the repair was successful.

Certainly I would give him a highly satisfied referral, if for no
other reason than being a knowledgeable, helpful person.

639. New R-390 mailing list.....

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-09 00:00:00 UTC
From: mc@shore.net
Message-ID: <61j1vi$ro6@northshore.shore.net>
Source record: 164221
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Annoucing a new mailing list:

The R-390 Mailing List is for the discussion of the features, operating, troubleshooting, repair, maintenance, improvements and general lore related to the R-390 family of radio receivers which were developed for military and government applications. This group includes the R-390, R-390A, R-392 as well as their variants such as the R-389 and R-391. These radios were designed and developed by the Collins Radio Company of Cedar Rapids Iowa but were made by different manufacturers under various contracts spanning almost 35 years from 1950 to 1984.

The List administrators are concerned with the growth of speculators and profiteers which have been pervading the vintage radio hobby of late. Consequently we have adopted the following guidelines on a temporary basis in the hope that the abuses seen elsewhere will not occur here. FOR SALE, WANTED and SWAP postings by PRIVATE PARTIES are acceptable but not encouraged due to the many other alternative outlets for that information. Furthermore, we request that such posts be limited to the equipment under discussion. Commercial postings, announcements and SPAM are NOT welcome. If in doubt of an article's suitability, DON'T POST IT and ASK!

It is hoped that all subscribers will contribute material to the R-390 List as it is the knowledge, wisdom and experience that will make t his list a useful, informative and valuable resource.

The advisory board of the R-390 List are:

Co-administrators are Chuck Rippel, WA4HHG, and Michael Crestohl, W1RC.

Historical Advisor is Tom Marcotte, N5OFF.

To subscribe to the list you can send mail to:

majordomo@qth.net

with the following command in the body of your e-mail mesage:

subscribe r-390

Please address any questions to: crippel@exis-net
mc@shore.net

PLEASE include [R-390] in the Subject: line

: > take long.

: I agree, for some, that method might be better. Maybe even for most people. I
: learned code myself too and was able to pick up the correct cadence very well from
: using an Iambic paddle from when I first used it. I now use both a straight key
: and an iambic. It just seems hard for me to understand how you would get any kind
: of feel for how the code is really supposed to sound if you are using a straight
: key. I feel that I send very good code, which is irrelevant, except that I
: apparently learned opposite from the way the "experts" say. I respect both of
: your opinions, and, I guess, for a lot of people you are probably right.
: However, I think the "Iambic first" method will also work for many other people
: besides me.

: Also, in my practicing to get up to 20 wpm a couple of years ago. I spent quite a
: bit of time on a qso simulator on the pc. I used a both a straight key and an
: iambic keyer. This is a very good way to get closer to technically perfect code
: as the computer is very picky about your code. At least mine was. Maybe they
: have more forgiving software now, but that "pickieness" helped me. Whad does
: anyone think about that? Anyone else use these sims on the computer?

: 73's de N7HM

I also used a computer software to learn CW. And maybe you think you
didn't need to start with a sraight key but you have used it after
and that has perhaps helped you to get the felling of the timing.
The fact that the straight key permits you to extend the dahs more
easily wich helps you in the beginnig !
Anyway, if already have a good transmition, you don't have to worry
anymore hi hi hi !

Best 73 and CUL

greetings.

I am looking for good shape radios, both mobile capable, used, one for HF and one for 2M/440.

I would prefer fairly late model but I will consider anything. on the HF rig, would give esp. consideration
to an Atlas mobile rig.

Desire is to setup a system for fairly low cost, not all fancy bells-whistles absolutely needed.

Brands preferred are Yaesu, Icom, Atlas.

Thanks,
ronan

>GPS unit. Two toys for the price of one... ;-)

All GPS receivers know the time to sub-microsecond accuracy internally -
it falls out of the navigation solution that they have to perform.
However, only some board-level GPS receivers have an output that is
synchronized to that time. For example, the Garmin GPS 20 has an output
signal that is usually within 1 microsecond of the beginning of each
UTC second. Other manufacturers have (more expensive) receivers that,
in certain modes, give about 50 ns accuracy.

But the cheap handheld GPS units do *not* provide this accuracy. Their
LCD display of time can be up to a second off, and the NMEA serial data
output generally isn't synchronized to the correct time either.

On the other hand, you can get GPS time just about anywhere that you have
a decent view of the sky. WWVB propagation is not that good.

Message-ID: <61jchh$a66@sunburn.snds.com>
Source record: 164229

Hello,
I'm wanting to get involved in working the satellites. I realize there are quite a number of ways you can configure equipment to start working them. Since I want to work some of the GHz bands, I realize I will need to probably get transverters and or some combination of transceivers. I've read about people using 2 meters, 70 cm, and 10 meter rigs with transverters. Is there an advantage of using one band over another? Is there a preferred combination (2 2-meters, 2 meter/70 cm, 10 meter/##)? I've heard it is best to have all mode rigs.
Is there any advantage to using a dual band radio (IC-821H, FT-736) or single band all modes?? Is one manufacturer considered better than another??

Thanks in advance,

Roger KB9LBU

once again I try the ever-helpful Net ..

I recently got hold of a National NCX-3 and a Butternut HF6V, both without manuals. The NCX-3's power supply connector was demolished by the previous owner's cat (presumably with a little help from Mr. Gravity) and I can't seem to get the wires connected to the right pins. A schematic would help me immensely, especially with a manual that could give me a better idea of how to go about tuning up the transmitter final. I can probably figure out the IF alignment if I can just get it working.

I also need the tuning info for an HF6V. Like the previous, I can probably get by on guesswork, but it takes so long and I hate to duplicate someone else`s work. Email would be fine for this; I don't really need a manual all that much.

Finally, I'd like to find the UHF wide-band receive mod for my TH-79A. I know there are two diodes I have to remove, but which two, and on which board, and do I have to remove both if I only want to receive? (Email definitely for this one -- no need to broadcast to the world..)

Thanks all, and 73! One more crack at the code test and I should be a General by wintertime .. right now I'm a 'code-challenged' General .. ;-)

Well, one could ask for a device meeting the specs similar to some
devices that used to be on display in glass cases at the National
Atomic Museum in Albuquerque, NM. These were piezo "batteries"
designed to deliver something like 800V at 250A for 2 1/2 nanoseconds,
in tiny little cases with big fat leads.

There are only a few applications for devices of that type, none of them
pleasant.

Source record: 164232
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.misc,

Another consideration is battery life. I have yet to see a GPS that runs for more than a few hours on penlight batteries, but the cheapo Radio Shack WWVB clock I bought last week runs for <N-yet-to-be-determined> weeks/months on 2 AAA cells.

Also not all GPS units will work indoors w/o an expensive ext. antenna.

My RS clock seems to be picking up WWVB sufficiently well in the SF Bay Area CA, and the WWVB web site says there are improvments planned that will make the signal even stronger.

Message-ID: <61j9bu$p67@harp.cs.ubc.ca>
Source record: 164233

I would also recommend the ADMS software. By laying out exactly what registers that are available to be programmed, it tells you a lot about the internal "state" of the radio - some of which it is difficult to find in the manual.

For example, from playing with the software, I discovered that there are four separate logical "bands" of operation for each of the two virtual VFOs, and *each* of those 8 (total) sets of operating configuration has its own memories for step size, etc. From reading the manual, you'd think that each VFO has one set of operating parameters, not four sets depending on the current frequency range.

Once I knew, from the software, what the "internal state" of the radio really looked like, I was no longer surprised by the radio doing different things than I thought it should have done.

I have the following, and would like to trade for a dual or tri band mobile and/or dual or tri band desktop. I'm looking for something no more than 3 years old. Here's what I have:

-Kenwood HF SSB Transceiver (TS-180S) with 160, 80, 40, 20, 15, and 10m bands. WWV (10.0 MHz) SSB/CW/FSK, desktop mic (Kenwood MC-50), speaker (Kenwood SP 180), and power supply (Kenwood PS-30). Has D.F.C. memory unit upgrade.
-DenTron MT-3000A Antennae Tuner and DenTron linear amplifier MLA-2500B.
-Computer Patch Interface by (Advanced Elec Apps, Inc model CP-1)
-Hybrid Phone Patch (Heathkit HD-15)
-Beam antennae rotator (Alliance Dual Speed Control)
-Vibroplex key.
-Microlog Corp's ACT-1 TTY.

Feel free to make a cash offer.

ATTENTION: Drake Amateur Radio Equipment Owners / Collectors

The Drake Amateur Radio Club, with the permission of the
R.L. Drake Co., is now offering Baseball\Golf caps featuring the
"OLD" Drake logo, used on most of the Drake amateur radio products.

The caps are California Blue in color, which is as close to
"Drake Blue" as we could get, and the white and black logo measures
1 inch high and 5 inches wide across the front of the cap.

USA Cost $15.00 each, shipping included. Outside of USA,
E-Mail "DRAKEARC@AOL.COM" and request the charges for shipping
to your QTH. Please provide your complete shipping address.

Caps will be shipped from the R.L. Drake Co, Franklin, OH production
facility.

To order, send a MONEY ORDER for $15.00, (per cap) US funds, made
payable to: "Drake Amateur Radio Club" and send to the address below.

Drake Amateur Radio Club
ATTN: Radio Room
230 Industrial Drive
Franklin, OH 45005

Be sure to send a cover letter along with your money order providing
the number of caps ordered, your name, address, and a daytime phone
number (or internet address) and any special shipping instructions.

NOTE: PLEASE DO NOT contact the R.L. Drake Co. for information
about or to order caps. This offer is made from the Drake ARC and
it's members. For additional information, or comments, you may send
E-Mail to "DRAKEARC@AOL.COM"

The members of the Drake ARC, thank for your support.

I am having trouble with a FT-51R. When I set the step to 12.5 for 440Mhz. Enter a freq. in VFO and try to save it in memory... it drops 10khz. Strange. Spent 65 minutes with Yeasu techs... three resets... and no results. I can set the step at 12.5. Go to VFO, then back to memory... step back to 25khz (Same the other way around). Yeasu can't help... can you? Did I buy a lemon? The step wants to be 25khz no matter what I do to it. HELP.....

SCO, So when you are shouting "good morning" to your neighbor across the street, is this a private communication when I can hear it next door? Keep your private communications out of my receiver, and your privacy will be respected as much as possible.
As far as rights being "violated," as best as I can figure, the only right we have left is the right to remain silent. This is because anything we say or do can be used against us in a court of law. 73,
N0iMD

An electric window crank motor, a couple of sprockets , some chain
and a bit of work, will yeild a quite acceptable
12 volt rotor-

I have even just jamed a small pipe over the gear shaft and clamped the
motor to a board with a muffler clamp - but this is only good for
small VHF and UHF Yagi arrays.

positonal feed back can range from a simple- variable
resistor and meter to a shaft encoder with associated electronics etc.

Have Fun

John,
I have two of them, and they seem pretty good. I'm not on VHF of UHF FM very often, so I'm probably not the person to be giving a critical review of thier performance. But, they seem pretty rugid, easy to put in your inside pocket. The antenna is a little long, but shorter ones are available. If you don't need the higher power, I would go with the smaller battery.
If you have any specific questions, please send them to me via email.

Package For Sale:

Yaesu FT-840
Yaesu MD-1 Microphone
MFJ Deluxe Versa Tuner II
Astron 35M Power Supply

This is a beautiful starter setup, but it will also take you into the future.

We bought this outfit 2 yaers ago hoping to motivate ourselves to upgrade to General class. Unfortunately we couldn't make time to do it. (2 kids, working overtime, you get the idea) This gear is in MINT conditon. It was used for monitoring only, 1-2 times a month.

1000$ will buy you the whole enchilada. At this point I would rather not break up the set. Please make an offer to radio4sale@santoro.com. This e-mail alias will be removed after the rig is sold (to avoid spam).

I am also tryong to decide which radio to get at this time.
They all seem to have something I like or dont like. 6 Meters in
the radio doesnt matter at all, when I get back into VHF it will
most likely be a FT-736.

Jim I would also like to know why you would not consider a Yaesu FT-1000MP ?

Another question I have is; is the 1000MP an upgrade of the 1000D or a new
radio ? And why is the Price of the 1000MP
about $1500 less than the 1000D ?

Howdy,

The normal calling frequncy is 432.100 for SSB operations. In some
areas there is an activity night on Wednesday at 20:00 local time.

You might try contacting Antique Electronic Supply here in Tempe AZ.
They buy/sell/trade tubes and all maner of antique goodies and are a
nice bunch to do business with.
Their web page is http://www.tubesandmore.com/
No I don't work for them, just a customer.
BTW, they also have these tubes in either a pair of 3-some all matched
for your drake gear.
Good luck. Mike Baker K0QZ k0qz@primenet.com

683. Experiences with Astron switching power supplies

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-09 00:00:00 UTC
From: davem@cs.ubc.ca
Message-ID: <61i4u8$3u1@harpo.cs.ubc.ca>
Source record: 164303

I see that Astron has a line of switching power supplies designed for powering communications gear. Of course, it will be much smaller and lighter than the equivalent linear power supply, a feature that I would be fond of.

However, I wonder about noise (various kinds). Would anyone who has used one of these Astron supplies comment on:

- does the little fan run all the time, or only when the temperature inside the case or on the heatsink gets high enough? (I.e. if I'm powering a transceiver that sits using 100 mA during receive, will the fan run all the time anyway, or will it kick in only when I've been transmitting for a while?)

- does the supply make any audible high-frequency noise

- Is the output electrically well filtered enough that it doesn't add any noise to the transmitted audio or RF?

Dave

Hello Robert!
Lets see if I can give you some background info that may make some sense.
First item is the power. This radio uses a pair of the jap equivelent of the 6146 beam power tetrode called the S2001, and a 12BY7A as the driver. This was at one time (back in the '60s) the defacto standard combination in a lot of radios. A pair of 6146 or 6146A tubes were rated at 180 Watts PEP INPUT or about 100 Watts output. A pair of 6146B tubes had a bit more plate disipation and were capable of 240 Watts PEP input and about 115 Watts output provided you could also raise the plate voltage to about 850 volts. Otherwise, if you plugged in the "B" tubes you only got the benifit of a bit more plate disapation and no change in output. The output varied a bit downward as you went from 80 to 10 meters usually because the drive dropped off from the 12BY7A and with a well used driver and pair of 6146s you would commonly go from 100watts at 80m to 75watts on 10m.
The bottom line here is, don't expect more than 100 watts output MAX from your TS520, that is all it is capable of. On 10m, more like 75 to 85 watts depending on the age and condition of the finals and driver.
BTW, the Kenwood rigs (TS820-TS520 etc.) that used these tubes were one of the very few who actually went from class AB2 linear service to class C when you switched from SSB to CW. Result: greater output on CW and cooler tube operation. If that doesn't mean much to you then get an old '60s or early '70s ARRL Handbook and read up on vacuum tube operation and it will make more sense to you.
Now on to the problem you were describing.
My best guess at this point is that you are getting a false reading on your Watt meter. I don't know what type/Mfg/ meter you are using or what type of dummy load but I would suggest you get a hold of a friend/fellow ham and try checking it out against a know, accurate meter and load. The old Heath Cantenna or similar is a pretty raliable and accurate load. If the meter you are using is say for CB use, don't belive anything it tells you. Almost all of them are not accurate even on 10meters let alone anything as far removed as say 80 meters.
One of the best investments you can make is purchasing a Quality watt meter. A Bird 43 is nice but a bit expensive especially when you get a bunch of slugs for it to cover any frequency and power range. My personal favorite (also not cheep) is the Diamond SX1000. It covers every ham band from 160m to 1300 Mhz (excluding 220Mhz) up to 200 watts. Other Diamond meters work well in the HF bands and don't cost as much. Another goodie is the Yaesu wattmeter, about a Hundred bucks and covers HF and up to max output.

One thing about tools. If you find good ones that work well and you find you can trust them, KEEP them. They can be your biggest asset when trying to chase down a problem.
Oh, one more passing thought came to mind. I assume (a dangerous thing to do I know but,) you have a GOOD ground on your antenna tuner. Translation: Good RF Ground.= as short a heavy wire or braid as possible connected to a 10' piece of 1/2 to 3/4 inch copper pipe driven in the earth untill only a few inches protrudes above the soil and soldered to the connecting wire to which the other end is connected ONLY to the RF signal sorce (i.e. radio).
Without a good ground some antenna tuners that have a built in meter system will indicate falsely.
Well, If I haven't board you to death with my little trist on your problem (don't you just hate it when you fall asleep reading your e-mail and your nose ends up on a key so long the screen is full of crud) I hope it gives you some insight.
I worked in the Ham Radio industry back in the mid and late '70s and now work part time for the largest chain of Ham Radio stores. I enjoy helping others with problems (mostly cause I have had them all myself at one point of another) and would be happy to answer any further questions you might have regarding your instalation.
Good luck and perhaps I will run into you on the bands....

>IC-W32A dualband handheld

I've had mine about three weeks and love it. Good audio, nice features, user friendly. I particularly like the alpha display and channel programming software features.

There are a number of default functions accessible by a single key; you can reprogram this; this is good, but also bad in that some functions are not easily accessible. For example, you set the squelch and leave it, unless you want to reprogram. That is ok, but if you're in the habit, as I was, of opening the squelch to check the radio battery, then you're in for some work. OTOH, with this machine I haven't had any battery problems, yet (see below).

Be sure to buy an extra battery and the speed charger - lets you recharge in about an hour. Learn to practice safe battery practice: run it down until it complains, then charge it up quickly then leave it alone until the next cycle...

I would recommend it. The'50 is so feature rich, it greatly simplies the programing process. Also, If you like to use it as a scanning reciever, it let's you quickly change the programming by dumping in a new file. Works well if you travel a lot too.

To answer your other question, yes, you could exchange files via e-mail. Say you were planning to visit a friend (who just happened to own a '50 :-{)), he could e-mail a file with local programming.) Or, for example, for a large Public Service event, where there are a doz. frequencies (Boston Marathon, for example) you could distribute a file to participants.

I think it's worth it. It's too much work to reprogram it via keypad.

Andy:

To open the squelch on the W-32A, press the key directly above the
push-to-talk key. This key opens the squelch and changes the receive
frequency by the offset amount. In other words, it allows the user to
listen on a repeater input frequency.
I've owned a W-32A for almost a year and enjoy it. 73.

Source record: 164161

Hi
I recently purchased a Kenwood TM261A here in New Zealand. I had read the information on the rig on the Kenwood USA www page before buying it. I live near to the Auckland International Airport and one of the things I liked about this rig was that it could be tuned to listen to aircraft on VHF. I rang the local agents and they verified that this was so and so I went and bought it. On getting it home I found that it only went down as far as the top of the aircraft band and not on AM. I rang the agents back and they apologised saying they thought that it was the same as the more expensive model, and that obviously the NZ sets are different to the ones made for USA. I can't afford the more expensive model so I would like to know if anyone can help me with a modification for my set to make it perform the same as the ones made for the USA market.

Any help would be apprecieted.

The battery is in the front panel and it takes a special tool to get the panel apart. The tool alone costs $30.00 - I know as I just bought one. I have half a dozen Kenwood radios. Find out what they want to replace the battery, but if it is under $50.00 or so, it'll pay to have Kenwood do it.

My opinion

First, yes I know it is illegal to do it (and I don't).
Second, I know there is probably a better group but I can't find it on the list I have.

But, at our ham meeting last night we got to talking about the scanner bill that is in congress and to subject came up.

Now here is the question: Is it possable to hear both sides of a cell phone conversation on a single freq. I say no. Cell phones are full duplex, one freq. goes from the radio to the tower and the other frome the tower to the radio. Two of the people there said that in %90 of the time they can here both sides of the conversation. What is going on.

Thanks

I suggest that you read the bill and not make judgements without
reading it. I should preface this with the fact that HR2369 is being
"reworked" as the author admits that it was "flawed", but the bill
would have changed the 1934 Commuications Act to read "intercept and
divulge" to "intercept or divulge". It would be illegal to listen to
anything as a third party that was not exempted. The exemptions are
public radio and TV, ham, CB, and unencrypted TVRO. As such,
listening to the aviation bands would indeed be illegal.
I am in favor of the cellular telephone industry either going
digital encrypted or informing people that they are,in effect, talking
on a radio and their conversations are capable of being intercepted.

700. FT-767 info/opinions?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-10 00:00:00 UTC
From: sbabb@lpub.NoQRM.com
Message-ID: <61l7rc$qbl@news-central.tiac.net>
Source record: 164170
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.dx,rec.radio.amateur.space

I'm looking for a "new" HF radio.

My Icom 730 has served well, but I'm looking for something that will cover 160 meters and give me more sensitivity and better filtering (particularly on SSB.) I like dxing, ragchewing, rtty/amtor/packet, and contesting. I live down the road from KC1XX, so I don't even see myself as a "little pistol" in contests (maybe more of a "rusty slingshot") but I enjoy seeing what I can do with my R5, doublet, and 100 watts.

I saw a Yaesu FT-767 GX II at the Rochester, NH hamfest last weekend. I didn't get much of a chance to look at it because someone bought it (for $1400 or so, I think) within minutes of me starting to look at it. It had modules for 6M, 2M, and 70cm. This interested me because I'd like to take a shot at the satellites, and it would also let me operate 6M dx and maybe a few of the local repeaters.

Since then, I've poked around dejanews and the web looking for info on this radio. As often happens, I found more questions than answers. So I've brought my questions to you:

1. What is the difference between a FT-767, a FT-767 GX, and a FT-767 GX II?

2. How are the filters in this rig? As 20 meters gets uglier, better filters seem to be what I need the most (followed by more receiver sensitivity.)

3. You can contest with any radio, but some are better than others. Do any contesters have comments on this rig?

4. Anyone want to comment on their experiences with the VHF/UHF modules and satellite work?

5. Are there other rigs that are as versatile as this one appears to be?

Thanks and 73,
Scott WA1VHT

(Please remove the "NoQRM." from my return address to reply.)

Remove the "NoQRM." in my address to reply. Don't you hate unsolicited e-mail advertisements? Me too. I apologize for the inconvenience.

Hi David -- lots of books I'm sure at the Library -- but briefly --
The base band transmits Left plus Right audio. Also sent is a 19 kHz
pilot carrier and a double sideband suppressed carrier multiplexed
signal at 38 kHz containing left minus right information. The 19 kHz
pilot carrier is sent to allow synchronization to generate a 38 kHz
carrier which is used to demodulate the 38kHz double sideband
information which yields left minus right audio. Adding and subtracting
this from the baseband gives left audio and right channel audio.

Also multiplxed is a mono SCA -- store cast signal at some higher
frequency -- I forget this one but 57 kHz or so, I believe.

>(and the only reason this came about is that ole' NEWT got burnt)
>
And the way Newt got burned is by a couple listening (against the law) in their car ... then making a tape (against the law) ... then sending that tape to a democrat congressman (against the law) ... who then committed a federal crime by playing that tape to the public. But because he played the tape on the floor of the House he is protected from prosecution.

I wonder ... has that couple been prosecuted under the federal statues yet? They certainly should be to the maximum extent of the law to set an example for others!!!!

In case I was unclear, the difference between UTC and GPS time is an
integral number if seconds. When I wrote "about 12 seconds" it is
because I don't recall the number and not because it is a non-integer.

Looking for used scanners.

Unit can have any number of channels - hand held or base - older units or new (no crystal units). Must work flawlessly, have original accessories, and be in reasonably good cosmetic condition...original carton and manual would be nice, but not necessary.

Please describe the scanners features, operating condition and appearance in your reply..

Thanks,

John & Robert
St. Louis, Mo. 63116

P.S. We can also trade ham gear instead of paying cash - if you're interested in a swap, inquire for list of equipment available.

709. Used Cellular Phones???

Is there any place in the country that one can buy a used cellular Phone.
I am told by Radio shack here that if you can acquire a cellular fone
used at a nominal price, (and its not a stolen item), then you can use
it for emergencies (911) calls without any charges whatever. What
a wonderful emergency tool this would make. I never bought into the
system yet because I would not use a cellular if I knew I was paying
access monthly charges etc when all I want it for is an emgergency tool
in case of a car accident, heart attack, or whatever but if the above
is true (and radio shack insists its true that the FCC wrote it into
law that no exchange can refuse a 911 call from any cellular user
regardless if he has a monthly access fee or not. If I could buy one
for thirty or forty bucks it would be well worth it for 911 calls alone.

Yes

Hello Dave,

Don't compare the Astron Power Supplies with power supplies for linear
amplifiers. The only thing in common is that they are power supplies.

My 20 amp Astron doesn't even have a fan. Therefore the answers to
your other questions are shown above.

714. RE: REC RADIO DATABASE

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-10 00:00:00 UTC
From: Andrew <andrew@tropicom.net>
Message-ID: <343E53F2.BC0EF6D3@tropicom.net>
Source record: 164184
Cross-posted to: rec.radio.swap,rec.radio.shortwave,rec.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

I have often wondered how most people can be so trusting when dealing with perfect strangers on the internet. I myself am a cautious person by nature. I have been screwed by stores, mailorder houses etc. So far I have had very good luck selling some of my ham stuff on Rec.Radio.xxx Newsgroups. I realize there are more good people trading here than bad ones, so don't take this in a negative mannor. I was wondering how many people would be interested in my idea.

I was thinking about creating a Web Page just for us Ham Rec Radio swappers that would benefit Ham/Rec Radio Swappers. Here is my plan.

To have a very short and concise either FTP or WWW site that would list a persons name, trade, date, and references (past dealings with) and a short summary of whatever anyone who delt with that person would like to say about his or her trade (short and to the point). All information would be voluntary and all information would be posted as to who said what. This in a very short time would become a database of people you could look up and check out before dealing with them. You could even e-mail their references to verify them.

Here is a possible sample:

John Doe jdoe@anywhere.com XD4111 Last Updated 07/14/97

Jane Doe,radio1@pc.net.uk,XD5333 - I sent $500 for a Yaesu FT-8500 and it was everything he said it would be, it was sent out on time and I am happy. 7/97

Sam Muttle,smuttle@y.com,XD5555 - I sent $45 for an Icom W2A that was supposed to be in 100% working condition when I received it it didn't work, he worked with me to get it right and now everything is OK. He's a good man and I would deal with him again. 7/97

Jane Doe radio1@pc.net.uk XD5333 Last Updated 10/10/97

Paul Had,phad@gg.com,XD4442 - I sent her a check for $200 for a Yaesu FT-50 that needed some work, after sending many e-mails, regular mail and telephone calls, I still have not received my stuff! I would never deal with her again. 8/97

Harry Whit,hwhit@yup.com - I sent her a US Postal Money order for $550 for a Yaesu 757 that was supposed to be brand new in the box with all paperwork. What I received was a 757 that had many scratches on it and

an old really beat box with a torn manual. The radio also did not function properly. She refused to return my money and I would never deal with her again. 9/97

All of the above info of course is made up, but this should give you an idea on how my mind sees it. I think that all of us could really benefit from a database like this. It would be up to all the posters to send me mail in a specified format (I would have a submit form to fill out) and I would put this into the database at least every other day. I have no idea how many people would contribute to this, nor how much the expenses would be on my behalf, but I would be willing to donate my time for free and people could send in donations to pay for the Web Costs involved. There would of course not be a mandatory charge for the service. I have no plans to offer this to any other news groups. This is just to benifit us hams, and Scanner traders or anyone else who uses the Rec.Radio.xxxx groups. No Commercial business or reference would be allowed, no slander, no bad carma, and no abusive language, whatever is posted whether it be positive or negative will be the responsiblity of the posting author who sent it to me.

I would like any input on this idea that you have. Please post all response to the "REC.RADIO.SWAP" newsgroup so we can all get involved Put in Subject to your post; "RE: REC RADIO DATABASE". If you have any private ideas you can email me directly.

This site has not been formed yet and based upon your response, is whether it even will.

Good luck to all on your swaps.

Andrew

You have been advised well. FT 2500 is one of the best rigs ever made.
Nice display and loud clear audio for noisy cars. I regret the fact I
sold mine to buy an ft 8000. Although the 8000 has a lot more features
and very wide coverage it still doesn't compare to the sound or quality
of the 2500. Good luck, wise choice. VE3NGW/W4 Florida

Only the unwise are trusting. There are as many crooks on internet as anywhere else (including stores).

The wise shopper can lower the odds on a deal especially a ham deal. The call sign address better match the home address of the seller and buyer.

The phone number, name and address better match the above.

Work phone number can be verified.

I can go on and on. If you are an easy chump you will be taken advantage of so better stay in your basement and hide (baw haw haw). If your a tough cookie you are less likley to be a mark. If it does not smell good - try another fish.

I have bought and sold on internet and NEVER had a problem.
Request a scanned image. Ask very specific questions about damage, wear etc.

Its no differnet with new equipment. The add only tells the good news. You really have to use internet newsgroups to check the true good and bad points. I point out that prior to these news groups we only had magazine reviews which were very easy on the manufacters. Rarely critical even with a glaring problem. So thanks to Internet we can get much more info and questions answered form actual users.

I make sure I know who I am dealing with as outlined above.

>

Simple, the telephone companies (and cell companies) try to treat telephone conversations as 4 wire circuits as much as they can. That is, microphone signals travel on 2 wires, and earpiece signals travel on another 2. At your central office, they combine the microphone and earpiece paths in a device called a hybrid and connect them to a 2 wire circuit that goes over the telephone poles, and eventually to your telephone. Your telephone has another hybrid in it that combines the 4 wire circuit in your handset and connects it to the 2 wire circuit that comes down from the pole. Microphone signals travel down the wire towards the phone company, and earpiece signals travel down the wire towards your phone.

In a perfect world, the hybrids would do a perfect job of splitting the microphone and earpiece signals, and you would never hear both sides of the conversation when listening in on a cell phone signal....However, the world of cheap telephones is anything but perfect, and the hybrids in cheap phones generally reflect alot of the signal intended for the earpiece back towards the phone company. This is called echo.

Now I can hear you thinking: "If the hybrids are so bad, why don't we get feedback in our telephones?" Well this concerned the telephone engineers of yore as well, and what they did to reduce the effect of this echo is make the signals coming from the telephone microphone 20 dB louder than the signals going to the telephone earpiece. This makes any signal, intended for the earpiece, that echoes off of the hybrid way more than 20dB quieter than the microphone signal. Back in the old days of noisy lines, this loss all but assured that the echo couldn't be heard. Now days with "you can hear a pin drop" lines, you can easily

hear the echo.

"What do you mean I can hear the ECHO...Echo...echo...echo.......?"
Well, you would hear the old grand canyon style echo if the lines
between your house and the central office were really really long, but
because they are short, all you can hear is a phase distortion that
makes your sidetone sound a little bit "big", but that's another story.

For sale ****** $950 USA Wg Condition

Specification:
Avcom Portable Spectrum Analyzer PSA-35A
RF input 10-1750 Mhz
RF input 3.7-4.2 Ghz
LNA/BDC PWR +18VDC on RF Inputs
Referance Level 0-(-40)dBm
5-slide band select 0-500,270-770,950-1450,1250-1750,3700-4200
6-Preset frequency band
span 0-50 MHz/DIV
scale dB/DIV 2db and 10 dB
Line and Bat operat

Frequency Coverage 10-1750 MHz 3.7-4.2 GHz
Basic enough to begin with - sophisticated enough to grow with .
Ku and C band compatible
Built-in DC Block and Power for LNA's and LNB's
Accurately measures wideband signals commonly used in the satellite
communications industry
Lightweight (17lbs.) and Portable - Ideal for Test Situations
Rugged, Attractive Styling
Made in the U.S.A.
New Priced
at /$1,965.00/in http://www.fotronic.com/avcom/psa-35aspecanal.htm.

Troubleshoot system problems by observing output signals from LNA's,
BDC's, Line Amplifiers and Splitters, and other RF signals components.
Measure block system signals balance.
Identify and resolve terrestrial interference problems quickly
and precisely by displaying offending signals on the PSA-35A.
Customers can be shown the nature of TI problems for clearer
understanding.
Measure and document satellite communication system performance after
installation or service. Customer should be given a copy of results per
AVCOM'S SASAR (Spectrum Analyzer System Analysis Report) to insure
customer confidence and satisfaction.

Progressive Satellite Communication Dealers, Repair Centers,
and Manufacturers will find AVCOM'S PSA-35A Spectrum Analyzer
to be an indispensible instrument for rapid testing and alignment
of satellite equipment. Problems that might otherwise take hours,
even days to resolve, can be identified and corrected in minutes,
saving time and money, while reinforcing customer good will.

An AVCOM Spectrum Analyzer will pay for itself quickly.

My price **** $950 USA

Why does the congresscritter receive protection from prosecution because
it was played on the floor? If he blows someone away on the floor is
he protected from 1st degree murder charges?

The congresscritter also gave a copy to a newspaper. That certainly
shouldn't be a "protected" action.

>I wonder ... has that couple been prosecuted under the federal statues

Anything spoken or read from the floor of congress is protected
speech. Killing someone on the floor of congress isn't
protected...unless
maybe some liberal lawyer tries to equate it with an act
of speech :-)

> Anyone know for sure?

Yes, GPS time (the internal time used by the GPS satellites and receivers to resolve time and location) is about 12 seconds ahead of UTC because of the addition of leap seconds into UTC since the start of the launch of the Navstar constellation. However the GPS messages which are sent from the satellites to the receivers includes the information on the number of these leap seconds at any time, and GPS receivers make the correct adjustment in order to display UTC (or the time in any other timezone you request) with full accuracy.

For not too many bux more you might consider a dual bander. Of course
if there are NO 70cm machines in your area then it would be a silly
choice. Often 70cm is less crowded so you can engage a ragchew easier
than on 2m in many locales. I find 70cm fun and with just enough
difference in propagation over 2m to add some space.

The base station (cell) transmitter transmits both sides of the
conversation. Like an ordinary landline phone adds a bit of your
side to the earphone output (Buzzword: sidetone). My guess is that
is also helps by indicating the quality of the link to the cellphone
user.

A cellular "phone" is a RADIO. It's frequencies are no different than
the ham bands or the aviation bands. It's interface is very similar to
a telephone, but it's a RADIO. More to the point, I hope you don't
really think this bill is about protecting cell phone users. If you do,
then you won't mind giving up your ham radio or your pilot's license
when they are considered to violate someone elses civil rights. After
all, you can spy on me in my back yard with that Cessna, and you can

plan the demise of our government with your ham buddies. You say that ham radio is on the private airwaves. How do you think a cellular phone works?

742. Which 2m FM rig?

744. Re: HF TRANSCEIVERS- Ten Tec vs Yaesu

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-11 00:00:00 UTC
From: Luke d'Hont <a0927429@dlemail.itg.ti.com>
Message-ID: <01bcd675$5dc8f520$0e5e5bc0@A0927429.itg.ti.com>
Source record: 164060

It keeps amazing me how Ten Tec invokes this unrealistic "loyalty" in
their customers. Their products certainly do not justify that behaviour.
In that respect, it reminds me of Apple computer users, the same senseless
loyalty, which is certainly not based on product performance, but solely on
emotions.

I have owned numerous transceivers, Ten Tec being one of them.
It sure didn't rank the highest in terms of performance and construction (
not the lowest either, but that's hardly the point here)

Take Paul's comparison that he posted, I attached it for who is interested.
How on earth can someone compare two transceivers the way he did: One
unit at one night, and the second unit the next night.
Don't you think the band conditions could have been different between
those nights? A meaningless comparison to my opinion.

If you want to compare transceivers, put them both on the bench at the same
time, connected to the same antenna by means of an antenna switch.
Then tune into that weak station and really see what transceiver comes out
as being the winner.

But somehow I don't think this Ten Tec -used "low-noise crystal mixing
synthesizer" will be able to beat a real DDS .
Come on, Ten Tec, don't be so afraid for a DDS. I'm sure you guys could
design one, and come out with a refreshingly new, US-made product for a
change. But I'm not holding my breath for it, as there is a lot on the
market today that beats any "Omni-VI" with flying colors.

Interesting comment. You are absolutely correct about quite a few
of the Ten Tec fans, and they sometimes act without thinking very
scientifically. However, they are in the minority, and many Ten
Tec owners are RF engineers who know what they are doing. It depends
on what you want out of a radio.

>> Take Paul's comparison that he posted, I attached it for who is interested.
>> How on earth can someone compare two transceivers the way he did: One
>> unit at one night, and the second unit the next night.

I read his post that you attached and it seems to indicate that he
took his radio to the other guy's house where they compared the two,
and they reversed it the next night. I suspect they had the radios
on at the same time. Maybe you read it differently.

>> But somehow I don't think this Ten Tec -used "low-noise crystal mixing
>> synthesizer" will be able to beat a real DDS .

That is an interesting point. It is my impression that crystal mixing
does not produce phase noise, but that synthesis does. Now, you can
create quieter and quieter synthesizers, but the crystal mixing scheme
avoids the problem entirely. How can DDS ever be "better" in that
respect? I know that DDS is now implemented so as to impress many
folks, and I know it works. I respect the FT 1000 a lot. But it
needs to eliminate a source of noise that the OMNI VI doesn't even
need to contend with. A big difference? I don't think so, but it
is there.

>> change. But I'm not holding my breath for it, as there is a lot on the
>> market today that beats any "Omni-VI" with flying colors.

How do you mean this? I don't understand. I have had the FT 1000D
and the MP in the shack along side of my OMNI VI and they never "beat"
the OMNI VI in any signal I could find. I can't say the OMNI VI "beat"
them either, but I was able to dig out the weak ones in such a manner
that it made a difference to me with the OMNI. I now own that one.

I am no Ten Tec fanatic, I just like the design philosophy of the OMNI.
It has no wide "roofing" filter like the Japanese rigs do, it starts

right up with a good solid filter, then goes down the chain in a good simple manner.

My second favorite rig is the Kenwood TS 440, by the way. No shining example, but all around it does 99 per cent of what any other radio can do after a few simple improvements.

As long as you keep the transmitter power low and use directional antennas
you should have no problem. You could either use an unoccupied uhf tv
channel or some unused amateur band frequency. Alternativly use one of
the frequencys designated for general short range such as walkie talkies.
Chances are nobody will even notice much less complain.

Cross-posted to: rec.ham-radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.swap,rec.radio.swap

I have for sale an Icom IC-281H 2M mobile radio. This radio has been mobile about 2 times. The rest of the time it has been my packet radio. I operate packet about 3-5 times a year whether I need to or not.

This radio has the extended receive modification (done by me) only. This opens up the RX capability to 118-135.995 MHz AM RX and 320-479MHz FM RX. Out of the box the radio covers 144-148MHz TX/RX and 440-450 MHz RX.

The radio is in mint, like-new condition and comes with the original box, manual, power cord, hand mike (HM-77) and mobile mounting bracket.

AES is currently closing out these radios for $379, I'd like to get $280 for it.

Please email me if you are interested.

73,
Tim

Nev,
The UTC clock is governed by an atomic based standard. This standard
produces a time that is very near the earth's rotation around the sun,
but not exactly.

UT1 is based on the earth's rotation around the sun.

Since the atomic-based clock (UTC) is not exactly synchronized with
the earth's rotation around the sun it must be adjusted so that the
difference between the UTC and UT1 times is never greater than .9
seconds.

What I just wrote above is stated in the material you provided below.
So, I'm not sure I understand your question, but I've taken a stab at
it anyway.

For Sale: Kenwood TS-820 transciever with internal power supply= Puts out 200w PEP
for SSB on 120/220V or 120W PEP for SSB on 13.8V DC.= Bands are 160 thru 10M=
All solid state except two 6146B finals and one 12BY7A driver all of which are brand new. Includes microphone and manual.

AT-200 tuner/swr/wattmeter with same HF bands as noted above.= Includes manual.

Both are in excellent operating condition and are ideal for mobile or base station use.

Both are hooked up and can be demonstrated in Punta Gorda, Florida

Price is $495.00 for both items. Does not include shipping which will be about 50#.

Very nice radio with hand mic and manual. 2@ full output 6146s in final, and a reciever that has to be experienced!! Matches or exceeds many later radios, in every respect. All bands about 125 out! Clean clean radio.$525.o and split the shipping, its a bit heavy but really well made! If you like Kenwood 830s and 930s you will love this radio. Dont know what to compare it too in Icom, but it hears better than my new 756!! Thanks Murray, Will ship COD for $6 and youll love this radio.

760. Short range video tx

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-11 00:00:00 UTC
From: ka9jwx@juno.COM
Message-ID: <19971011.012313.7135.9.KA9JWX@juno.com>
Source record: 164115

Hello Robert.
900 mc is shared by the hams with non-hams. Go get a Rabbit video transmitter/reciever set. These are used to transmitte signals from a vcr, cable box, or satelite dish down converter to tv recievers equiped with the companion reciever.
Put a set of beams for this band on the roofs of the houses & have at it.
If you use these things stock right out of the box, no one will be the wiser or even care. You might want to put a pre-amp in line from the beam to the 900 mc reciever.
I am sorry that you got a bad impression of ham radio, but transmitting on the uhf ham band without the proper license is a no no.
You didn't do anything wrong, all you did was ask a simple question.
These guys didn't understand what you wanted to do or why. You asked the wrong question at first, but now you asked the right one.
I hope that in the future you will get a license & join us.
Don't worry about everything people say.
Let me know how it works out for you.
Paul Webster, KA9JWX,
ka9jwx@juno.com

761. Use of silver cleaning dip to clean electronic parts?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-11 00:00:00 UTC
From: Stanley Perkins <stan@netcom.com>
Message-ID: <343EE990.9A8CF162@netcom.com>
Source record: 164116
Cross-posted to: sci.electronics.repair,sci.electronics.equipment,rec.radio.amateur.boatanchor,rec.radio.amateur.equipment

For the past few weeks, I have been using a silver cleaning dip to remove the tarnish from BNC connectors and other silver plated parts on my test equipment. It's absolutely *amazing* how a ten second dip in this stuff (thiourea) can remove years of tarnish and restore the parts to a like-new appearance.

It appears to work on other metals, too, but the container warns against using it on anything but silver. It also warns against dipping parts for more than ten seconds.

Does anyone have experience with this technique? Why the ten second warning? Why the warning about use on other than silver? Is there a downside to doing this such as long-term degradation of the parts?

Thanks in advance,
Stan

Message-ID: <343F1266.B51FE2DA@ihug.co.nz>
Source record: 164118

Hi,
I recently purchased a Kenwood TM261A here in New Zealand. I had read the information on the rig on the Kenwood USA www page before buying it. I live near to the Auckland International Airport and one of the things I liked about this rig was that it could be tuned to listen to aircraft on VHF. I rang the local agents and they verified that this was so and so I went and bought it. On getting it home I found that it only went down as far as the top of the aircraft band and not on AM. I rang the agents back and they apologised saying that they thought it was the same as the more expensive model, and that obviously the New Zealand sets have different specs to the ones made for the USA. I can't afford the more expensive model so I would like to know if anyone can help me with a modification for my set to make it tune from 118 to 136 AM, the same as the ones made for the USA.

Any help would be appreciated.

Regards.

#1. MFJ 989C in excellent shape. Never arced and lookin good! I have much better luck with these than more expensive models!! $215.oo shipped and insured to your door. $221 if COD and thats ok with me!! Oh yeah, it s a 3 KW unit if you didnt know.

#2. AEA QT-1 300 watt tuner, several years old and a little scuffed but a very fine smaller tuner. They were expensive new, but I will ship this one for $90 and it will treat you the same as a new $160. MFJ!!

#3. MFJ 962C Another biggie, but with "differential T" type tuner. Looks perfect and works the same. $185 shipped.

All these guaranteed in good condition as stated, or your money back!

TRADES OK.

768. SB-200 Choke Fire

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-11 00:00:00 UTC
From: k3ky@juno.COM
Message-ID: <19971011.045320.7014.0.k3ky@juno.com>
Source record: 164123

There was someone who posted a message about burning up
the 45uH choke in his SB-200 a second time. I hope I am putting
this on the right reflector, as I'm trying to remember what was
going on a week ago. In the meantime, I have had time to think
about the message I posted in response, while I waited 5 days
or so for my computer to get worked on. I had suggested that
the choke fire might have been the result of a parasitic oscilla-
tion 'event'. I didn't have my brain in gear at the time. Parasitics
will destroy or damage tubes, meters, bandswitch wafers,
bias zeners, and plate tuning capacitors (usually just arcs but
doesn't wipe them out.) I don't believe they will ordinarily wipe
out a plate choke. The 45uH choke in the SB-200 refered to here
is the plate choke, right? I haven't had my hands on an SB-200
or it's schematic for at least a year, so again, I'm relying on my
memory. Anyway, I believe choke fires are more likely to be
caused by operating too near one of the series-resonant freq-
uencies of the choke. Some chokes have no resonances below
30MHz, and so are pretty safe in any 160-10 meter amp. The B&W
800 choke and the choke used in the SB-220/221 are both exam-
ples of this, I believe. Some chokes, however, were designed
in the old (pre-WARC) days, and happen to have one or more
resonance parked between the higher HF bands, say at or near
18 or 24MHz. If you try to use an amp with such a choke on a
WARC band and it happens to fall near one of the choke reso-
nances, high RF current passes through the choke to ground
and the choke fries. In addition, it is equally possible that some-
one could have such an incident and then rewind the choke so
it even has resonances that fall in one of the traditional higher
bands (20/15/10.) The answer to both problems would be to
get a dip meter and check the new choke for resonances
while it is mounted in place and with a temporary short across
it. I have seen some good descriptions of this simple procedure
in an ARRL publication somewhere. An exact replacement choke
should be carefully checked for any resonances on 17 or 12
meters before operation is attempted there, and a field-rewound
choke should be checked at every HF frequency. The homebrew
choke, even if an exact duplicate of the factory choke, could have
very different electrical characteristics due to a difference in
the insulation film on the wire, winding technique, etc. Of course,
the grid-dipper check of the plate RFC is performed with the amp
off, unplugged, and the HV supply fully discharged! 73, David

769. Used cell phones.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-11 00:00:00 UTC
From: ka9jwx@juno.COM
Message-ID: <19971011.012313.7135.13.KA9JWX@juno.com>
Source record: 164124

Hello Joe.
Yes there are places where you can buy used cell phones that are not hot-at ham fests. I bought an NEC 3 watt cell phone, several adapters for power & antenna connections, & a power supply for $10 at Dayton Hamvention 97.
I went to Ameritech & got pickup & go Cellular service for a $35 activation fee & got 30 or so minutes free. I went back & got 54 more Minutes for $30.
I use the phone in the car with the flexible antenna on it. The phone hangs by it's handle on my console gear shift in my 85 Pontiac 6000. I plan to put a 5db antenna on the roof of the car for the phone latter to extend its range.
I live in the NorthWest Indiana area & have pretty good performance out my phone where its at, but an outside antenna will take care of the areas that give me trouble as far as acessing the cell sights. I have cell phone coverage from Wisconsin to about SouthBend Indiana.
911 calls (they are *999 on a cell phone like mine) are free. I know because thats what the Ameritech people told me besides after my phone ran out of airtime, I called the police using *999 & got through.
You don't have to buy air time, but why not. The airtime is good for 60 days & believe me, you can use that up & get your moneys worth without trying, so its not a waste. It helps to be able to call a friend on the phone from the car to get directions to his place or to let someone know that you will be late or early. Also other people can reach you in case a loved one or close friend is sick or hurt. Add a basic pager for more versitility.
Primeco has a better deal then the one that I got but they don't have as big a coverage area as I got. I picked Ameritech because my friend who knows more about this stuff than I do said he wasn't too happy with CellOne audio quality.
If you don't buy air time with a carrier, you will be using the same carrier that the last owner had & you may not like that co.
Eventualy, all this stuff will have to be digital to be compatible but for now my used analog NEC is it. Its a good supplement to my ham mobile rigs.
Good luck in what ever you decide to go with.
Paul Webster, KA9JWX,
ka9jwx@juno.com

Source record: 164128

I use Tarnex to clean silver plated parts. The silver sulfide is reduced and sulfur dioxide is released.(smells like rotten eggs) I have not heard of the ten second rule. My guess is that if some dissimilar metals are involved say due to soldering or brazing, there may be some electrolytic action that might produce some corrosion products or discoloration if allowed to sit in the solution too long. Be sure to rinse parts well after the treatment.

73,

Joe---W1PNH

>Dave W9VI
Well, assuming that the IC751 is the same. Sounds like the PLL is out
of lock. Check for 6.5 V on R46 @ 7.9999Mhz mode LSB General. Adjust
C78 to get the correct voltage measurement. Says in the service manual
to use an oscilloscope but a digital volt meter -should- (haven't
tried it so might be wrong) work if you don't have one. Or if you
don't have a meter, try tweaking it so that your receive comes
back-checking to make sure that it works in the whole band from 100Khz
to 7.9999Mhz.
C78 adjust for 6.5V @7.9999Mhz
In case you also need to adjust for the next 3 bands.
C88 adjust for 6.5V @14.9999Mhz mode USB General
C97 adjust for 6.5V @21.9999Mhz
C107 adjust for 6.5V @ 29.9999Mhz
Confirm measurements by checking for 3V at 8,15 and 22Mhz.
Look for the PLL board, the large square metal can toward the back of
the radio has the adjustment points in it. There will be 4 holes in
the top to access the adjustment points. The hole closest to the front
of the radio is C78, the next one behind it is C88, next is C97, next
is C107. R46 is on the left side of the metal can containing the
adjustment points and a little less half way to the middle of it.
Marked on the board so should be easy to find. The PLL board that you
are looking for is found by taking the bottom cover off of the radio
and it will be the board to the right hand side as the radio is upside
down with the front facing you. That is my opinion of what needs to
be adjusted- hopefully it will help. I had the same problem once and
that did the trick. Actually I did a full alignment but that was the
adjustment procedure that was out of whack.
-Dave

Go to Icom's FAQ site and look under 751A. If it isn't covered it should
give you some clues..

> Is there any advantage to using a dual band radio (IC-821H, FT-736) or
>single band all modes?? Is one manufacturer considered better than
>another??

Wow, lots of questions. A quick word about transverters. For the 2m
and 70cm bands, a 10m IF is normal. For higher frequencies, a higher
frequency IF is preferred to reduce image responses. So a 1.2 GHz or
2.3 GHz transverter will normally have a 2m IF. You *can* cascade
transverters if necessary, but that isn't generally desirable.

Another quick thought about transverters. They typically want around
5 mW of transmit signal. With some transverters and some transceivers,
this can be somewhat difficult to arrange. Many transceivers can't be
set to that low an output, so you have to use an attenuator between
the transceiver and the transverter. But if the transverter has a combined
IF port, the attenuator will also be in the line on *receive*. This is not
good, so you need to switch it out somehow. If the transverter has a
split IF, and the transceiver has a separate Rx antenna connection, it
becomes much easier to make them work together.

Most satellite operation uses the SSB or CW mode, though some
use FM, so an all mode setup is best. Dual band transceivers can
be convienent, but they can sometimes be limiting too, especially
if your setup becomes complex. I've operated both ways, and
recently went back to separate radios (IC735, IC275H, and
IC475H), a handful of transverters, and a number of amplifiers.

My previous radio was the very popular FT736R dual band
(actually tri-band with an optional module) radio. It is a good
satellite radio, but I had my eye on P3D, and some terrestrial
weak signal work, and wanted a more flexible configuration.
There are probably more people using the FT736R on the
satellites than any other radio, or combination of radios,
however, so it is well worth considering.

The IC821H is also a good combination satellite radio. The
only radio I'd urge you to avoid is the Kenwood TS790A.
Kenwood didn't think this one through very well, and it has
several deficiencies as a satellite rig, though it has good points
as a terrestrial Dxing radio.

I am interested in purchasing a used HF xrcvr rig. I m looking
for at least a triple conversion receiver one. All bander of course. I am
willing to spend upwards of $1000. I am currently looking at a Kenwood
940SAT and an Yeasu 757. Are both of these bases and have their own power
supply?? Do these have 6M also. I don't care about digital. Can u recommend
a GREAT H.F. rig base (with internal power supply)? How do the 940 and 757
compare? Any other suggestions? I know that ICOM makes a model 706 (I and
II) that are H.F. xrcvrs with both 6M and 2M, but it is a mobile. Is there
any Base H.F. rigs that cover 160-10M with 6M also (2M is not that
important now as I would like to get a separate 2M base after an H.F.
base). I hear that Kenwood , Icom, Yeasu all make top of the line equipment
but the tech and general support from Kenwood is severely lacking... I am
perfectly willing to purchase an older unit such as an FT101 or something
similar but I don't know what all those older radios do nor any of their
specs. Is their a book that has pictures of all those old radios and newer
ones to with general specs? I would pay lots for a book like this. It may
sound silly to say but aesthetic do mean something to me, to the respect
that I want a one piece base unit not separate speakers, power supplies,
tuners, and separate VFO's, etc.
Please help me if u can thanx!

Can you name one?

The Omni V, VI, and VI Plus hear signals the others don't.
There is no better audio.
Sure, there are lots of fine Japanese rigs on the market, also
with bells & whistles you'll seldom or never use, which will
discontinue their proprietary parts long before the rig's
useful life is over, which are prone to overload from nearby
signals, which makes the operator blame the other guy for
having a broad signal, etc., ect.

But to each his own. I have had fun with Drake, Icom, Kenwood,
Yaesu, and Ten-Tec. Even a Heathkit can be fun. But I'll take
the Ten-Tec, thank you. ;-)

812. TS 440 / SSB low audio - ALC

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-12 00:00:00 UTC
From: turner@safety.ics.uci.edu
Message-ID: <22369.876697780@safety.ics.uci.edu>
Source record: 164015

I just got a used 440 and it seemed to have no ALC no matter how high the mike gain, and only got about 10 watts out. The CW output is just over 100 watts, fine. After about 10 minutes, it seems to pick up, and the ALC kicks up and I get 100 watts PEP. Keep it on for a while, and the ALC problem shows up again, no ALC reading and about 10 watts out. CW is still fine. No obvious intermittent connections in mike, cord, the audio processor makes very little/ no difference.

Anyone have any ideas? I am going to pull the radio apart and spray clean contacts and stuff as a matter of course. Just curious if anyone else has been through this.

Dale Clark who goes by Al,
Why is it that you seem to have truble with the question; "why are
you here if you dislike CB so much?"

A quote from an actual post by Dale (aka Al);

"Mostly CBer's are criminal"

You can say anything you want about me Dale and the point is I have
an interest in CB and that's why I read here. You on the other hand
have made several comments about CB and CBer's that put the "hobby"
and the people intrested in it in a bad light. That point only leads
a person to beleive that you are a moron for continuing to post here.
Gene

(Just what is it that Dale Clark performs for a living, I wonder?)

815. AT-150 antenna tuner and G5RV question.

> >
> > Ron Harshbarger
> > rnharsh@visi.com

To dissapate 3 watts in your 1 tera ohm resistor you'll need to put over
1.7 million volts across the terminals. Is this really what you have in
mind? If not you could put forty five 22 meggohm quarter-watt resistors in
series.

22 meg resistors are available at under a penny each. Terminal strips or
circuit boards can cause problems at this resistance so just tie the 45
resistors together in space unless you don't need shock mounting.

Hope this helps.

827. Icom IC-720a Info Requested

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-12 00:00:00 UTC
From: martyt@pobox.com
Message-ID: <34412bad.8111384@nntp.a001.sprintmail.com>
Source record: 164071

Looking for information about the Icom IC-720a HF rig - I have an opportunity to purchase one *real* cheap but don't know a thing about it and haven't been able to check it out personally yet. I'm pretty new to ham radio myself so I don't have the kind of background to know if this is a good rig or not.

If anyone could answer some or all of these questions, I'd appreciate it!

Was this a good rig? Good points? Bad points?
What's it worth, assuming it's in perfect operational condition?
About when was it manufactured?
Does it have the WARC bands?
Solid state or tube-type?
Built-in power supply or 12v DC?

This rig will be for my dad who hasn't been on the air in almost 20 years; he didn't recall the model number so it must be newer than that. It doesn't need to have lots of bells and whistles, just to be a good performing, basic, solid rig.

Any comments would be appreciated. Please reply via e-mail as my newsfeed has been on the flakey side lately...

73,

-Marty KC0AKA

If you mean accuracy to one or even to single digit nanosecond
accuracy, I've not heard about them. And 10^-12 doen't mean anything
to me as a measure of a clock's accuracy, perhaps this refers to the
accuracy of a frequency sub-standard?

Why would the use of a cesium timebase that is orbiting a few hundred
miles up and perhaps a couple of thousand miles away be more accurate
than one that is closer to you without uncertain propagation delays?

Regards,

Looking at the data sheets, it appears there is a price to pay in battery life for HT's: the dual receivers draw considerably more current in standby. Am I missing something here? Is there a way (on any models) to avoid this, such as disabling the unused band? Or am I all wet??

Source record: 164087

Hi all,

I've been doing QRP (5W) since I started out as a ham, some 8 years ago. After obtaining DXCC with QRP, I'm thinking about building a 50 to 100W linear, so I can work towards the Honor Roll. (Yes, I know that I can do that with QRP, but I'm not *that* stupid...)

My current ATU (homebrew) won't take 100W, so I'll need a new one. I'm thinking about the MFJ-969, with roller inductor. Is this a good buy? Or do you recommend a different one? It should tune a dipole used on all bands ("doublet antenna") and/or end-fed wire, on 80 to 10 mtrs.

Please your comments. By email would be great.

TIA, 73,

Frank

Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

Looking for used scanners.

Unit can have any number of channels - hand held or base - older units or new (no crystal units). Must work flawlessly, have original accessories, and be in reasonably good cosmetic condition...original carton and manual would be nice, but not necessary.

Please describe the scanners features, operating condition and appearance in your reply, along with your asking price...

Thanks,

John & Robert
St. Louis, Mo. 63116

P.S. We can also trade ham gear instead of paying cash - if you're interested in a swap, inquire for list of equipment available.

Amp Supply (formerly Dentron) is defunct. It's owner, Dennis Had K8KXK, went on to more lucrative adventures- now is Cary Audio making high-end tube audio gear. One of his techs started a company called Omega Electronics also located in the southeast. I don't have his adr/phone # handy but he does advertise in I think both CQ and QST. He services most any amp incl. Dentron and Amp supply. Hope this helps... 73-Brian K3USC-Erie,PA

Ron,

I assume the 3W is a size. Depending on your application, you may have to specify any number of other parameters. I wouldn't advise just getting any surplus resistors until you refine your requirements and get data sheets for the specific resistors. Try Victoreen. They've been making high value resistors for decades, and they have great application notes on their web site. It is:

http://www.victoreen.com/

853. AT-600 Smart Charger

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-12 00:00:00 UTC
From: Don Felgenhauer <donf@iea.com>
Message-ID: <344122F3.1834@iea.com>
Source record: 164097

The 12 volt power cord that comes with the AT-600 should not be used with the Smart Charger. The charger requires a negative center conductor. The 12 volt cord has a positive center conductor.

If you do use it (like I did!), the fuse in the cord or the fuse in the charger will fail. To replace the charger fuse: remove 2 screws beneath the back rubber feet; remove the bottom cover, replace the fuse.

Wasn't there ten amendments to the original Constitution?
If so, then if a member of Congress breaks the Constitution, what
recourse do we Americans have?
I'm not sure , but I'd assume the CONSTITUTION wouldn't protect
members for their official
violations of our God ordained rights.

BTW, The Constitution isn't worth the paper it's written on.

As long as Americans elect Republicans or Democrats for office, we'll
always be screwed.
They're 2 divisions of a one party system.
The Govt. forbids or restricts everything in this country that is neat
or cool.

I know that a lot of people here are mad at the FCC.
But I'm sure that the FCC is having it's strings pulled.
So place your anger somewhere higher than the FCC.

We deserve all this punishment that we are receiving.
If a country can elect Bill Clinton , not once but twice, deserves no
freedom at all.
At least Adolph loved his country and was a nationalist.
Billy boy is open to the highest bidder.

Sad but true

Message-ID: <61uc14$3mb@bolivia.earthlink.net>
Source record: 163911

Hello, I would like to use my Standard C5718DA for 1200 baud packet by using the
supplied 8 pin DIN connector to connect a DRSI DPK-2 (TNC-2) compatible but
the manual has me a bit confused. The manual explains how to wire the 8 pin DIN for
9600 baud and also explains a separate way for 1200 baud but mentions using
optional cables for 1200 baud.
I would like to know how to wire the 8 pin DIN for 1200 baud or do I really
need to buy the optional cables. Thanks for replying.

I have 4 new 4CX300A's for sale. These tubes are packaged for
military use and have a rubber cover with leads attached to the
breech block base. The cover and leads can easily be removed
if necessary. I'm asking $50 each OBO + postage or UPS shipping.

I also have 4 other 4CX300A's which may or may not have been
used. They have some staining on the chimneys which may
have been caused by the old black foam packaging they were in. I'm not
sure. These are from the same batch as the new ones and three of them
are in original boxes. I would be happy to make a good package deal
for someone if they were interested in these. I'm asking $80 OBO for
all 4 + shipping.

I have just acquired a Hal Telereader, Model CWR-6750. The unit seems to work great but I am unable to get it to decode RTTY. Maybe if I followed directions it might work.
Anybody out there have the instructions for me to follow. I would like to find a copy of the Operator/Service manual for this unit. Be glad to pay for all copying costs and postage. Don KB6GQA

> appreciated--thanks and 73

Tune the radio for maximum power out at 21.3 mhz into a dummy load. Turn off the SG switch in the back and adjust the neutralizing cap for minimum signal. If you don't have a tapped wattmeter with a scope then use a receiver tuned to the same freq and adjust for minimum S-meter reading. Turn the SG back on or no power out.

Unless you are just a very casual ragchewer don't trade. The 450 works
better in crowded conditions. The receivers are just as sensitive but
the selectivity is not the same.

Hi David -- lots of books I'm sure at the Library -- but briefly --
The base band transmits Left plus Right audio. Also sent is a 19 kHz
pilot carrier and a double sideband suppressed carrier multiplexed
signal at 38 kHz containing left minus right information. The 19 kHz
pilot carrier is sent to allow synchronization to generate a 38 kHz
carrier which is used to demodulate the 38kHz double sideband
information which yields left minus right audio. Adding and subtracting
this from the baseband gives left audio and right channel audio.

Also multiplxed is a mono SCA -- store cast signal at some higher
frequency -- I forget this one but 57 kHz or so, I believe.

Hi Blackrobe,

Us "radio types", as you put it (at least this one), take offense at
your audacity. We have worked hard to attain the necessary licenses
and expertise to do what we do legally and professionally, and you
don't even have the common decency to check out the FCC regulations,
which YOU KNOW WILL PROHIBIT YOUR DOING THIS.

Why don't you just connect a cable from your transmitter to the
receivers in question and avoid the possibility of Federal
prosecution?

From: Tom Currie <TOM.CURRIE@postoffice.worldnet.att.net>
Subject: KDK FM-2016A

Anyone remember the KDK FM-2016A 2m xcvr? I've got one (around here
somewhere, buried under junk in the shack) but it won't transmit any
more. When keyed it appears to try to key up (the TX light comes on)
then it quits (TX light goes out, display blinks ONCE then stays on),
and of course no outgoing signal. This is not the behavior the manual
says should happen if the PLL fails to lock (which says the display
should keep blinking) but I think it is either the PLL failing to lock
or the PLL saying it failed to lock.

If someone recognizes this problem and knows a reasonable fix, please
let me know.

I have to assume that the Kenwood rigs that you refer to are at least
similar to my TS-450.

The 13 pin connector (ACC2) was not intended for AFSK (so far as I
know). It is used for FSK. I use pins on the ACC2 as follows:

Pin TS-450 Label Kam PLus Label

2 RTTY terminal FSK
3 Receiver Audio Audio (RCV)
5 GND GND
9 Transmitter keying PTT

If your pin numbers do not corellate to this, try going by signal
label.

Nev,
The UTC clock is governed by an atomic based standard. This standard
produces a time that is very near the earth's rotation around the sun,
but not exactly.

UT1 is based on the earth's rotation around the sun.

Since the atomic-based clock (UTC) is not exactly synchronized with
the earth's rotation around the sun it must be adjusted so that the
difference between the UTC and UT1 times is never greater than .9
seconds.

What I just wrote above is stated in the material you provided below.
So, I'm not sure I understand your question, but I've taken a stab at
it anyway.

Subject: Butternut HF9V-X experiences wanted

I've worked (and confirmed) all 50 states QRP with my HF-6V (same
antenna, but without WARC and 160m) as well as working about 150
countries, most at 100 Watts or less.

These antennas are a "booger" to tune, but once you get 'em set up
right, they work VERY well. Mine kicks butt on 40 meters!

Subject: FS: Drake old logo golf caps

ATTENTION: Drake Amateur Radio Equipment Owners / Collectors

The Drake Amateur Radio Club, with the permission of the
R.L. Drake Co., is now offering Baseball\Golf caps featuring the
"OLD" Drake logo, used on most of the Drake amateur radio products.

The caps are California Blue in color, which is as close to
"Drake Blue" as we could get, and the white and black logo measures
1 inch high and 5 inches wide across the front of the cap.

USA Cost $15.00 each, shipping included. Outside of USA,
E-Mail "DRAKEARC@AOL.COM" and request the charges for shipping
to your QTH. Please provide your complete shipping address.

Caps will be shipped from the R.L. Drake Co, Franklin, OH production
facility.

To order, send a MONEY ORDER for $15.00, (per cap) US funds, made
payable to: "Drake Amateur Radio Club" and send to the address below.

Drake Amateur Radio Club
ATTN: Radio Room
230 Industrial Drive
Franklin, OH 45005

Be sure to send a cover letter along with your money order providing
the number of caps ordered, your name, address, and a daytime phone
number (or internet address) and any special shipping instructions.

NOTE: PLEASE DO NOT contact the R.L. Drake Co. for information
about or to order caps. This offer is made from the Drake ARC and
it's members. For additional information, or comments, you may send
E-Mail to "DRAKEARC@AOL.COM"

The members of the Drake ARC, thank for your support.

From: k0qz@primenet.com (Mike Baker)
Subject: Puzzling

Hello Robert!
Lets see if I can give you some background info that may make some
sense.
First item is the power. This radio uses a pair of the jap equivelent
of the 6146 beam power tetrode called the S2001, and a 12BY7A as the
driver. This was at one time (back in the '60s) the defacto standard
combination in a lot of radios. A pair of 6146 or 6146A tubes were
rated at 180 Watts PEP INPUT or about 100 Watts output. A pair of
6146B tubes had a bit more plate disipation and were capable of 240
Watts PEP input and about 115 Watts output provided you could also
raise the plate voltage to about 850 volts. Otherwise, if you plugged
in the "B" tubes you only got the benifit of a bit more plate
disapation and no change in output. The output varied a bit downward
as you went from 80 to 10 meters usually because the drive dropped off
from the 12BY7A and with a well used driver and pair of 6146s you
would commonly go from 100watts at 80m to 75watts on 10m.
The bottom line here is, don't expect more than 100 watts output MAX
from your TS520, that is all it is capable of. On 10m, more like 75
to 85 watts depending on the age and condition of the finals and
driver.
BTW, the Kenwood rigs (TS820-TS520 etc.) that used these tubes were
one of the very few who actually went from class AB2 linear service to
class C when you switched from SSB to CW. Result: greater output on
CW and cooler tube operation. If that doesn't mean much to you then
get an old '60s or early '70s ARRL Handbook and read up on vacuum tube
operation and it will make more sense to you.
Now on to the problem you were describing.
My best guess at this point is that you are getting a false reading on

your Watt meter. I don't know what type/Mfg/ meter you are using or what type of dummy load but I would suggest you get a hold of a friend/fellow ham and try checking it out against a know, accurate meter and load. The old Heath Cantenna or similar is a pretty raliable and accurate load. If the meter you are using is say for CB use, don't belive anything it tells you. Almost all of them are not accurate even on 10meters let alone anything as far removed as say 80 meters.
One of the best investments you can make is purchasing a Quality watt meter. A Bird 43 is nice but a bit expensive especially when you get a bunch of slugs for it to cover any frequency and power range. My personal favorite (also not cheep) is the Diamond SX1000. It covers every ham band from 160m to 1300 Mhz (excluding 220Mhz) up to 200 watts. Other Diamond meters work well in the HF bands and don't cost as much. Another goodie is the Yaesu wattmeter, about a Hundred bucks and covers HF and up to max output.
One thing about tools. If you find good ones that work well and you find you can trust them, KEEP them. They can be your biggest asset when trying to chase down a problem.
Oh, one more passing thought came to mind. I assume (a dangerous thing to do I know but,) you have a GOOD ground on your antenna tuner. Translation: Good RF Ground.= as short a heavy wire or braid as possible connected to a 10' piece of 1/2 to 3/4 inch copper pipe driven in the earth untill only a few inches protrudes above the soil and soldered to the connecting wire to which the other end is connected ONLY to the RF signal sorce (i.e. radio).
Without a good ground some antenna tuners that have a built in meter system will indicate falsely.
Well, If I haven't board you to death with my little trist on your problem (don't you just hate it when you fall asleep reading your e-mail and your nose ends up on a key so long the screen is full of crud) I hope it gives you some insight.
I worked in the Ham Radio industry back in the mid and late '70s and now work part time for the largest chain of Ham Radio stores. I enjoy helping others with problems (mostly cause I have had them all myself at one point of another) and would be happy to answer any further questions you might have regarding your instalation.
Good luck and perhaps I will run into you on the bands....

Subject: TM 241 A

The battery is in the front panel and it takes a special tool to get the panel
apart. The tool alone costs $30.00 - I know as I just bought one. I have
half a dozen Kenwood radios. Find out what they want to replace the battery,
but if it is under $50.00 or so, it'll pay to have Kenwood do it.

My opinion

Subject: WTB HF and dual-band Mobiles

greetings.

I am looking for good shape radios, both mobile capable, used, one for
HF and one for 2M/440.

I would prefer fairly late model but I will consider anything. on the
HF rig, would give esp. consideration
to an Atlas mobile rig.

Desire is to setup a system for fairly low cost, not all fancy
bells-whistles absolutely needed.

Brands preferred are Yaesu, Icom, Atlas.

Thanks,
ronan

Subject: Care and feeding of NiCad batteries

I was privy to hear a discussion of batteries some months ago
at a Laurel, MD ARC meeting. The presenter was a battery
specialist for NASA payloads.

1) NiCad batteries DO NOT exhibit "memory" as we've all been led
to believe. A "false bottom," indicating "now dead" when only
1/2 of life has been used, DOES NOT EXIST. In completely,
exactly cyclic use, NiCads have been known to have the voltage
per cell suddenly drop from 1.2 to 1.1 volts at a predictable
point in time, but it DOES NOT AFFECT CAPACITY.

2) NiCd batteries LIKE to be float charged because recombination
of materials occurs spontaneously within the battery. Charging
for too long, too fast, or with too much current can cause death
due to overheating, causing a valve to open and release electro-
lyte.

3) DO NOT DO NOT DO NOT drop a battery pack below 80-90% of
nominal voltage. Why?

All cells DO NOT charge/discharge equally. Say you have a
5-cell, 6.0 volt pack. One cell (2) is slightly weaker
than the others...which of course happens...

As I remember the discussion (not exact from the lecture but
serves to demonstrate the point):

Charge state Total 1 2 3 4 5
Fresh 7.0 1.40 1.38 1.42 1.40 1.40
Nominal 6.0 1.20 1.10 1.25 1.23 1.22
90% 5.4 1.15 0.80 1.17 1.15 1.13
80% 4.8 1.05 0.60 1.10 1.08 1.07

So far, battery 2 is taking a beating but is still up.

However, remember, they tell you to FULLY discharge...

70% 4.2 1.00 0.35 1.00 0.95 0.90

and #2 is taking a terrible beating, but still > 0...

60% 3.6 0.90 0.08 0.90 0.87 0.85

and #2 is about dead. Any lower and it hits zero, then gets
reverse-charged. Do it once and it's an accident. Do it a
few times and your pack is hosed.

And you end up with a pack that won't charge above 5.5v no
matter how long you leave it on the charger.

And you buy a new pack.

DON'T FALL INTO THE TRAP! Remember, "memory" doesn't exist!

Try building your own kit.... Use the "MT 8880" and a simple M6800 proc.
It aint so bad at all....
Or use WinTone v.2.0.....

Subject: F/S ICOM IC-820H with stuff

FOR SALE: ICOM IC-820H VHF/UHF all mode rig with SM6 mic,
EX-1514 vox unit, Yaesu YS-500 VHF/UHF swr/power
meter, Cushcraft 2 meter 4 element beam,
Cushcraft 70 cm 5 element beam.

Package deal $1200

All equipment was purchased new in August of 1996...all in brand
new condition. The 820 has literally done nothing but sit on my
desk and look pretty, its been turned on and used maybe a dozen
times at most. The Yaesu meter was used to test the SWR on the
two antennas right after I put them up...it has done nothing
since. I bought the equipment thinking that I'd get a little
more active in VHF/UHF operating...but...it ain't happening...
so...

Hello V C and Mary,

I understand the TS-50 is a nice, affordable rig with 100 watts on 160
through 10. How can you beat it? I paid $850 for a used IC-751A,
which I dearly love and has all the features anyone could want.

Subject: KS870s vs IC756

I am also tryong to decide which radio to get at this time.
They all seem to have something I like or dont like. 6 Meters in
the radio doesnt matter at all, when I get back into VHF it will
most likely be a FT-736.

Jim I would also like to know why you would not consider a Yaesu FT-1000MP ?

Another question I have is; is the 1000MP an upgrade of the 1000D or a new radio ? And why is the Price of the 1000MP
about $1500 less than the 1000D ?

Subject: KS870s vs IC756

Jim,

Although I might not be able to provide any input to your decision, it might just be the place for me to BS for a while. I have played extensively on both of the rigs at the candy store and came to find out that I like the FT-1000MP the best. This is why I don't have any HF rig, yet!

It is strange that I set out for the price range between $2000 to $2300 and end up going to go for a $2700 radio (my wife is very mad at me on this). Yes both the IC-756 and the TS-870 are very, very nice rigs and there are pros and cons about the DSP implementations and other features such as CW dot chopping and AM filtering on the IC-756, and the so-called "Blow-By" on the TS-870. I guess I should let other people to comment on these open issues. My basic arguments are as followed:

If I want to be active on 6M as well, why would I need the TS-870? I debated on the question the most. I don't know if I would ever be active on 6M at all! If I would be active on 6M, I think I would pick the IC-756 in a heartbeat. Simply due to the sporadic nature of the 6M

band and a spectrum display will be a giant help. My life style suggests that I need more time spent with my kid more so than waiting for the band to open. So 6M is out of the picture for me.

OK. I must admit that I might be active on 6M someday. I believe that I would need a backup rig, too! Something like the TS-570D, FT-920, or IC-706 should fit the budget. By the time I really need that "Wideband" coverage, the IC-746 will come along and it is supposed to be about the same price as the FT-920. Hey! I am in no hurry on a good "Wideband" rig! IMHO, ICOM shouldn't have let me know about their "next 756". hehe... It might not be a replacement to the 756, but it's bad enough that I know I have a choice now if I wait long enough.

That's why I want to concentrate my muscle on HF. There is no way I can affort the IC-775DSP or the FT-1000D unless the bonus check is much much bigger! The TS-950SD? I don't know how they can get rid of the inventory if they don't lower the price. hehe... Sorry for those of you who have the TS-950. Hi Hi. The TS-870 is at the $2300 range, but why sattle with that when the FT-1000MP is just $350 more? I have done all my homework in search of a good HF rig and I think the FT-1000MP is the best for me. I can pop all the filters in gradually so it is not too conspicuous to my wife's hawk eyes on our spendings ;)

It seems to me that many people are dumping their TS-870 in the swap NG. I don't have the specific explanation as to say why, but it suggests to me that some people are beginning to look for alternatives for their operating needs. May it be the 6M coverage and the spectrum scope? I don't know. If they like the TS-870's IF-DSP implementation, why getting rid of it? I also don't know the answer. But I have used the FT-1000MP and I feel it's batter for me over the TS-870.

Good luck to you on your big decision! Let us know what you are going to get!

Best 73!

David I guess this is why they make differant models and have differant manufacturers. I wouldn't even consider a 1000 MP.

Subject: Learning CW: Straight Key or Iambic?

Matthew Hone (mhone@itsnet.com) wrote:
: I agree that is is important to learn the correct cadence. But I think it
: would be better learned by first using the iambic keyer. This way all the
: cadence that you hear is correct, and then as you change to the straight key
: sending code with correct cadence will come naturally.

No quite like that !!
The truth is that to transmit code correctly you should first learn
with a straight key because when you start your transmission is slow
and it is easier to do it with a straight key.
Also, to learn the correct timing you tend to extend the "dahs" at
the beginning to get a more compreesible transmition.
If you start too soon you a iambic key you will never get in your

mind the sensation of correct cadence and so you will tend to
send poor code because space between words and letters will be
hard to tell and your correspondent will have trouble to
understand you !
My advise (by personal experience, and I learned code by myself!)
and for what I have read in several articles in magazines by
specialists in the matter, everyone should learn code with a straight
key and use it untill they get up to 13 WPM, only then should one's
change to the iambic key.
I used a straight key untill I got to 13 WPM, and now I use a
Bencher iambic paddle. You must adapt to the new key but it doesn't
take long.

Subject: Learning CW: Straight Key or Iambic?

Being a veteran of the NOVICE license (a LONG time ago) we had straight keys
and the option of other straight keys or bugs. We developed our CW skills on
the air, one contact at a time. It was annoying to work a person trying to use
a bug (and later folks trying to use a keyer) rather than a person making an
honest concentrated effort with a straight key. Sure, some fists sounded like
crap... but they sent only the number of dits they needed to send. And the use
of a straight key reduced the urge to try to send 30 WPM when receive ability
was 10 WPM.

Eventually we increased sending and receiving ability to the point that it
was a PLEASURE to listen to the 13 wpm tape at the FCC office, sent with
perfect spacing and cadence.

Most of us have graduated to keyers, some to iambic (squeeze) keyers. And
occasionally an extra dit gets in there. Learn the code first, send only as
fast as your brain can talk to your hand... then learn the keyer later.

And practice ON THE AIR... the extra QRN, QRM, QSB etc will make you a better
operator.

Howdy,

The normal calling frequncy is 432.100 for SSB operations. In some
areas there is an activity night on Wednesday at 20:00 local time.

Andy:

To open the squelch on the W-32A, press the key directly above the
push-to-talk key. This key opens the squelch and changes the receive
frequency by the offset amount. In other words, it allows the user to

listen on a repeater input frequency.
I've owned a W-32A for almost a year and enjoy it. 73.

Subject: Help wanted for CAT-300 Repeater Controller

Hi and thanks for reading this posting,

I have recently taken over the programming for our club repeater and I am experiencing a few difficulties. I have tried to contact CAT over the Internet at their web page but it comes back URL not found. I have tried their telephone # but it is no longer in service. I am now wondering if the company has gone "belly-up" hi.

If anyone has a valid URL or telephone # I would appreciate it, failing that if anyone is currently using a CAT-300 and is familiar with the programming maybe you can give me some pointers.

Thanks and 73 de Larry VE3YET.

I don't understand ... Why isn't it good for a beginner? Is the analog dial a problem? It's about 50 watts out - plenty good for all the QSOs you can stand.

From: Phil Wheeler <w7ox@ix.netcom.com>

Subject: KS870s vs IC756

I'd go with the ICOM.

The TS-870S does not have provisions for adding non-DSP filters (xtal or mech) in the RF-level IF stages. Big disadvantage for CW.

I do see used IC-756's for sale. Look in rec.radio.swap

Phil

p.s. -- I have a TS-570D. AF stage DSP; BUT it does let me add a 500 Hz cw filter, a major plus over the (more expensive) 870S.

From: nbolle@ma.ultranetREMOVETHIS.com (Ned Bolle)
Subject: Yaesu ADMS software worth having?

I would recommend it. The'50 is so feature rich, it greatly simplies the programing process. Also, If you like to use it as a scanning reciever, it let's you quickly change the programming by dumping in a new file. Works well if you travel a lot too.

To answer your other question, yes, you could exchange files via e-mail. Say you were planning to visit a friend (who just happened to own a '50 :-{)), he could e-mail a file with local programming.) Or, for example, for a large Public Service event, where there are a doz. frequencies (Boston Marathon, for example) you could distribute a file to participants.

I think it's worth it. It's too much work to reprogram it via keypad.

Subject: YAESU FT-50R

John,
I have two of them, and they seem pretty good. I'm not on VHF of UHF FM very often, so I'm probably not the person to be giving a critical review of thier performance. But, they seem pretty rugid, easy to put in your inside pocket. The antenna is a little long, but shorter ones are available. If you don't need the higher power, I would go with the smaller battery.
If you have any specific questions, please send them to me via email.

882. Help needed to complete design of DFD3

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-13 00:00:00 UTC
From: neil <neil@aade.com>
Message-ID: <34425220.15C1@aade.com>
Source record: 163966

I need a little help to complete the design of DFD3.

Digital Frequency Display 3 is designed for the type
of radio consisting of a bandswitched crystal (or PLL)
controlled converter in front of a tunable IF. This is
most of the rigs from the 60's 70's and 80's. Examples
are FT-101, TS-520, all Collins rigs, most Heathkit SB
series rigs etc.

It measures the VFO and adds an offset stored in EEPROM
for each band. While it is manually programmable it
also has a unique feature in that it will auto-program
itself for many different radios.

What I need is the data for the auto-programming. I have
this data for the following:
FT-101
TS-520
SB-301
Collins 74A-1, 75A-2 and 3, 75A-4, R390/A, 52S-1, R-388
75S-3
FRG-7

If you have a rig that fits this description what I need is:
VFO tuning range (ie 1.955 - 2.955MHz)
Number of bands the rig has. (ie: 6)
for each band:
1)lower band limit (ie: 3.2MHz)
2)upper band limit (ie: 4.2MHz)
3)does RF increase as VFO increases (tunes forward) or
does RF increase as VFO decreases (tunes backward)
(you should be able to tell from the dial on the rig)
4)In some rare cases the VFO may be doubled to double
the band width. In this case is the VFO signal available
before or after the doubler? (the 75A-x series for example)

If you would like to help e-mail the data via link below.

Cross-posted to: sci.electronics.repair,sci.electronics.equipment,rec.radio.amateur.boatanchor,rec.radio.amateur.equipment

Yeahyeah, what W1PNH said.

The thiourea-based tarnish removers are handy for a quick
clean-up. As he noted, they do release a stink, and
you want to do this operation with good ventilation,
preferably outdoors. And you will want to rinse after you remove
tarnish. I prefer warm water with a little Dawn dish detergent --
it removes most dirt and gunk easily.

The ten-second dip is all you need. In fact, it's longer than
you need for most light tarnish, and a longer dip does not
seem to remove more tarnish, it just kills the solution. If
you can't get it clean in one dip, I'd wash and rinse, let
dry, and reapply the tarnish remover.

I can't guess why the manufacturer recommends against using
on other metals, but I'd certainly keep that in mind when using it,
and at least limit its use. You might find an answer in a chemistry-
related newsgroup.

The only downsides I know about the tarnish removers -- the
oxidization and subsequent reduction of metallic silver seems to
leave it "spongier" and more prone to tarnishing and flaking, and
while it seems that the tarnish remover actually can remove silver
plating, I think I'm seeing the after-effects of flaking. Also,
thiourea is a POTENT agent for fogging photographic film, so you
need to store and use it well away from any photo gear or supplies.
Oh yeah, and did I say how BAD it stinks?

887. Tono EXL-5000E PROMs

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-13 00:00:00 UTC
From: azoth@netcom.com
Message-ID: <azothEI04n1.KGL@netcom.com>
Source record: 163971

Hiyall,

Picked up a Tono EXL-5000E RTTY terminal at EEB Sat. afternoon. $50, with book, schematics, printer cable and box, I couldn't resist. It was only supposed to need a power switch.... Anyway, jiggered the power switch connections, and at least some of the analog circuitry is working, but the micro isn't running. The display has filament and high voltage, but remains blanked; the mark/space LEDs do the right stuff, and the supply voltages are OK.

Ah ha, says I, lookee here: the PROMs aren't original, and could contain anything, or nothing, or a bit-rotted copy of the Right Stuff. Hmmph.

Does anybody here happen to have one of these widgets? I think mine needs a firmware tansplant, so I'm looking to borrow PROMS, or dumps of same in S-record or other programmable format, or a binary image, or whatever.

I figure the 2764 contains the operational firmware, and the 2732 the character tables.

Any leads gratefully accepted.

Tnx es 73 de KF4FJH - RF Buchanan

888. Ultimneter 2000 wiring

Hi,
I recently received an Ultimeter 2000 from Peet Bros.
Unfortunately they did not supply the serial cable for connection to a PC,I`ve requested a replacement but have no guarantee that it will be sent. I`ve attempted to wire a cable with an existing 6 pin connector that I have. Does anyone know the wiring to the 9 pin connector ?
I know that black is the Ground but after that I haven`t a clue.
If anyone can help it would be appreciated.
Many thanks,
de Alan. (EI3EBB)

Hello,

I have just recently upgraded to an Advanced class license, and I wish to begin using HF. Up to this point, I am only using 2-Meters.

I need to know the best choice for an HF rig, and the best all-band HF omnidirectional antenna.

I am looking for the following features on an HF rig:
Full coverage on shortwave receive
Built-in antenna tuner
Built-in power supply
100W output
Digital tuning
Under $1000

Do all HF rigs come with microphones, or do you have to buy one separately?

Also, I am considering the Cushcraft R-7000 antenna. Is this a good antenna? Are most hams pleased with the results, or are there better antennas that do the same thing for less money? The list price of $380 is quite substantial, and I would like to know exactly what I am getting for that amount of money.

Please take a look at my homepage, then reply by e-mail if possible, as I do not read Usenet that often.

My homepage is at http://www.umd.umich.edu/~jlipchik
Go to the area where I mention ham radio.

Thanks for your time.

> conversatiosn. IT's NONE OF YOUR BUSINESS ANYWAY!!!

If you want to ensure privacy get a digital celluar phone and
stay in the cells that support that service. Otherwise you
are simply broadcasting an unencrypted signal over the airways.

Listening to the Police, File, Ambulance, baby monitors,
McDonalds employees, CORDLESS PHONES, and cellular phones is
something that people do. The law has always made revealing
private information illegal. Currently it is only illegal to
listen to an analog cellular phone, not a cordless phone.
Restricting access to scanners and monitors will not greatly
increase your privacy.

Hi,

Don't know if this is the appropriat place to ask this, but
I have a question regaring FRS radios in the carribean.

Family Radio Service Two Way Radios are approved by the FCC
to use without a license in the US and US territories.
It uses the UHF 462-467MHz frequency and puts out only 1/2W.

Can they be used in the southern carribean, specifically
Aruba, Cuarco, and St Maarteen which are not US territories?
Think Dutch/Netherlands. It's ok in the US territories
Think Dutch/Netherlands. It's ok in the US territories
of Puerto Rico and St Thomas Virgin Islands. What about
the other places?

Or can you please point me to where I can find out?
The FCC web page doesn't have anything other than US
and I can't find the other islands info.

Please email me since I don't read this newsgroup.

onkyo@wwa.com

Thanks in advance!
Howard

From: "JEEPMON" <jeepmon@interaccess.com>
Subject: Best Base

I am interested in purchasing a used HF xrcvr rig. I m looking
for at least a triple conversion receiver one. All bander of course. I am
willing to spend upwards of $1000. I am currently looking at a Kenwood
940SAT and an Yeasu 757. Are both of these bases and have their own power
supply?? Do these have 6M also. I don't care about digital. Can u recommend
a GREAT H.F. rig base (with internal power supply)? How do the 940 and 757
compare? Any other suggestions? I know that ICOM makes a model 706 (I and
II) that are H.F. xrcvrs with both 6M and 2M, but it is a mobile. Is there
any Base H.F. rigs that cover 160-10M with 6M also (2M is not that
important now as I would like to get a separate 2M base after an H.F.
base). I hear that Kenwood , Icom, Yeasu all make top of the line equipment
but the tech and general support from Kenwood is severely lacking... I am
perfectly willing to purchase an older unit such as an FT101 or something

similar but I don't know what all those older radios do nor any of their specs. Is their a book that has pictures of all those old radios and newer ones to with general specs? I would pay lots for a book like this. It may sound silly to say but aesthetic do mean something to me, to the respect that I want a one piece base unit not separate speakers, power supplies, tuners, and separate VFO's, etc.
Please help me if u can thanx!

Subject: FS: HF Tuners

#1. MFJ 989C in excellent shape. Never arced and lookin good! I have
much better luck with these than more expensive models!! $215.oo shipped
and insured to your door. $221 if COD and thats ok with me!! Oh yeah, it
s a 3 KW unit if you didnt know.

#2. AEA QT-1 300 watt tuner, several years old and a little scuffed but
a very fine smaller tuner. They were expensive new, but I will ship this
one for $90 and it will treat you the same as a new $160. MFJ!!

#3. MFJ 962C Another biggie, but with "differential T" type tuner. Looks
perfect and works the same. $185 shipped.

All these guaranteed in good condition as stated, or your money back!

TRADES OK.

Can you name one?

The Omni V, VI, and VI Plus hear signals the others don't.
There is no better audio.
Sure, there are lots of fine Japanese rigs on the market, also
with bells & whistles you'll seldom or never use, which will
discontinue their proprietary parts long before the rig's
useful life is over, which are prone to overload from nearby
signals, which makes the operator blame the other guy for
having a broad signal, etc., ect.

But to each his own. I have had fun with Drake, Icom, Kenwood,
Yaesu, and Ten-Tec. Even a Heathkit can be fun. But I'll take
the Ten-Tec, thank you. ;-)

>I've heard it is best to have all mode rigs.
> Is there any advantage to using a dual band radio (IC-821H, FT-736) or
>single band all modes?? Is one manufacturer considered better than
>another??

Wow, lots of questions. A quick word about transverters. For the 2m
and 70cm bands, a 10m IF is normal. For higher frequencies, a higher
frequency IF is preferred to reduce image responses. So a 1.2 GHz or
2.3 GHz transverter will normally have a 2m IF. You *can* cascade
transverters if necessary, but that isn't generally desirable.

Another quick thought about transverters. They typically want around
5 mW of transmit signal. With some transverters and some transceivers,
this can be somewhat difficult to arrange. Many transceivers can't be
set to that low an output, so you have to use an attenuator between
the transceiver and the transverter. But if the transverter has a combined
IF port, the attenuator will also be in the line on *receive*. This is not
good, so you need to switch it out somehow. If the transverter has a
split IF, and the transceiver has a separate Rx antenna connection, it
becomes much easier to make them work together.

Most satellite operation uses the SSB or CW mode, though some
use FM, so an all mode setup is best. Dual band transceivers can
be convienent, but they can sometimes be limiting too, especially
if your setup becomes complex. I've operated both ways, and
recently went back to separate radios (IC735, IC275H, and
IC475H), a handful of transverters, and a number of amplifiers.

My previous radio was the very popular FT736R dual band
(actually tri-band with an optional module) radio. It is a good
satellite radio, but I had my eye on P3D, and some terrestrial
weak signal work, and wanted a more flexible configuration.
There are probably more people using the FT736R on the
satellites than any other radio, or combination of radios,
however, so it is well worth considering.

The IC821H is also a good combination satellite radio. The
only radio I'd urge you to avoid is the Kenwood TS790A.
Kenwood didn't think this one through very well, and it has
several deficiencies as a satellite rig, though it has good points
as a terrestrial Dxing radio.

Here's some input on Amplifier chokes that you might find of interest.
I don't know enough about the SB-200 to know which choke was the
target of the discussion.

I have a Henry 2K, which is similar to most amps using 3.500Z's.
There is a filament choke in that rig that can't handle much more than
the cathode current, and I burned up mine twice.

Here's what happens in that rig. The filaments are in series such
that the filament choke connects between the two filaments and the
center tap of the filament transformer. If one of the two filaments
open circuits or it's pins make bad contact with the socket, you've
got a problem. The full 15 amps of ac filament current would like to
flow through that choke. It burns up pretty fast, although in my case
it was mostly smoke and smell before I got it shut down. In fact, I
still use it, because even tho it's worse for wear, it didn't get
completely destroyed - Hi ! Fixing the tube socket cured my problems.
It took two tries to get it right because I first thought it was the
tube pin itself.

They are usually seen for around $800-900US. Yes, they cover 10M, but
unless you need the WARC bands, in my opintion the L-4B is a better amp. A
good L-4B goes for around $600-700US.

Good luck.

> doesn't add any noise to the transmitted audio or RF?

Yes

Hello Dave,

Don't compare the Astron Power Supplies with power supplies for linear amplifiers. The only thing in common is that they are power supplies.

My 20 amp Astron doesn't even have a fan. Therefore the answers to your other questions are shown above.

Bob

This radio is operating perfectly, is a 4 million plus and looks very good, about 8 and a half or 9. Full out put , no problems, a good one! Has MC-60 base mic, and is a low use unit, not been contested! Will take trades that interst me, or sell outright for $850 and ship it to your door. This is a GOOD ONE! Murray

Subject: Listening to Cell phone on a scanner.

First, yes I know it is illegal to do it (and I don't).
Second, I know there is probably a better group but I can't find it on
the list I have.

But, at our ham meeting last night we got to talking about the scanner
bill that is in congress and to subject came up.

Now here is the question: Is it possable to hear both sides of a cell
phone conversation on a single freq. I say no. Cell phones are full
duplex, one freq. goes from the radio to the tower and the other frome
the tower to the radio. Two of the people there said that in %90 of the
time they can here both sides of the conversation. What is going on.

Thanks
Peter/KA5COI

Simple, the telephone companies (and cell companies) try to treat telephone conversations as 4 wire circuits as much as they can. That is, microphone signals travel on 2 wires, and earpiece signals travel on another 2. At your central office, they combine the microphone and earpiece paths in a device called a hybrid and connect them to a 2 wire circuit that goes over the telephone poles, and eventually to your telephone. Your telephone has another hybrid in it that combines the 4 wire circuit in your handset and connects it to the 2 wire circuit that comes down from the pole. Microphone signals travel down the wire towards the phone company, and earpiece signals travel down the wire towards your phone.

In a perfect world, the hybrids would do a perfect job of splitting the microphone and earpiece signals, and you would never hear both sides of the conversation when listening in on a cell phone signal....However, the world of cheap telephones is anything but perfect, and the hybrids in cheap phones generally reflect alot of the signal intended for the earpiece back towards the phone company. This is called echo.

Now I can hear you thinking: "If the hybrids are so bad, why don't we get feedback in our telephones?" Well this concerned the telephone engineers of yore as well, and what they did to reduce the effect of this echo is make the signals coming from the telephone microphone 20 dB louder than the signals going to the telephone earpiece. This makes any signal, intended for the earpiece, that echoes off of the hybrid way more than 20dB quieter than the microphone signal. Back in the old days of noisy lines, this loss all but assured that the echo couldn't be heard. Now days with "you can hear a pin drop" lines, you can easily hear the echo.

"What do you mean I can hear the ECHO...Echo...echo...echo.......?" Well, you would hear the old grand canyon style echo if the lines between your house and the central office were really really long, but because they are short, all you can hear is a phase distortion that makes your sidetone sound a little bit "big", but that's another story.

> Anyone know for sure?

Yes, GPS time (the internal time used by the GPS satellites and
receivers to resolve time and location) is about 12 seconds ahead of
UTC because of the addition of leap seconds into UTC since the start
of the launch of the Navstar constellation. However the GPS messages
which are sent from the satellites to the receivers includes the
information on the number of these leap seconds at any time, and GPS
receivers make the correct adjustment in order to display UTC (or the
time in any other timezone you request) with full accuracy.

In case I was unclear, the difference between UTC and GPS time is an
integral number if seconds. When I wrote "about 12 seconds" it is
because I don't recall the number and not because it is a non-integer.

From: Joseph Fenn <jfenn@lava.net>
Subject: Used Cellular Phones???

Is there any place in the country that one can buy a used cellular Phone.
I am told by Radio shack here that if you can acquire a cellular fone
used at a nominal price, (and its not a stolen item), then you can use
it for emergencies (911) calls without any charges whatever. What
a wonderful emergency tool this would make. I never bought into the
system yet because I would not use a cellular if I knew I was paying
access monthly charges etc when all I want it for is an emgergency tool
in case of a car accident, heart attack, or whatever but if the above
is true (and radio shack insists its true that the FCC wrote it into
law that no exchange can refuse a 911 call from any cellular user
regardless if he has a monthly access fee or not. If I could buy one
for thirty or forty bucks it would be well worth it for 911 calls alone.

You have been advised well. FT 2500 is one of the best rigs ever made.
Nice display and loud clear audio for noisy cars. I regret the fact I
sold mine to buy an ft 8000. Although the 8000 has a lot more features
and very wide coverage it still doesn't compare to the sound or quality
of the 2500. Good luck, wise choice. VE3NGW/W4 Florida

Does anyone know a way to prevent garbage from being posted on a newsgroup? I am thinking in terms of recent chain letter scams and postings like the recent "long leg girls", etc. kind of garbage. I have found that when I have tried to post a protest to the "author" all my mail has come back as undeliverable due to a fake email address for the poster of this trash. Is there any possible mechanism whereby an item could not be posted unless there was a good address for the poster?

Reply to group.

Subject: Kenwood TM261A

Hi,
I recently purchased a Kenwood TM261A here in New Zealand. I had read the information on the rig on the Kenwood USA www page before buying it. I live near to the Auckland International Airport and one of the things I liked about this rig was that it could be tuned to listen to aircraft on VHF. I rang the local agents and they verified that this was so and so I went and bought it. On getting it home I found that it only went down as far as the top of the aircraft band and not on AM. I rang the agents back and they apologised saying that they thought it was the same as the more expensive model, and that obviously the New Zealand sets have different specs to the ones made for the USA. I can't afford the more expensive model so I would like to know if anyone can help me with a modification for my set to make it tune from 118 to 136 AM, the same as the ones made for the USA.

Any help would be appreciated.

Regards.

From: k3ky@juno.COM (David E Sinclair)
Subject: SB-200 Choke Fire

There was someone who posted a message about burning up the 45uH choke in his SB-200 a second time. I hope I am putting this on the right reflector, as I'm trying to remember what was going on a week ago. In the meantime, I have had time to think about the message I posted in response, while I waited 5 days or so for my computer to get worked on. I had suggested that the choke fire might have been the result of a parasitic oscillation 'event'. I didn't have my brain in gear at the time. Parasitics will destroy or damage tubes, meters, bandswitch wafers, bias zeners, and plate tuning capacitors (usually just arcs but doesn't wipe them out.) I don't believe they will ordinarily wipe out a plate choke. The 45uH choke in the SB-200 refered to here *is* the plate choke, right? I haven't had my hands on an SB-200 or it's schematic for at least a year, so again, I'm relying on my memory. Anyway, I believe choke fires are more likely to be caused by operating too near one of the series-resonant frequencies of the choke. Some chokes have no resonances below 30MHz, and so are pretty safe in any 160-10 meter amp. The B&W 800 choke and the choke used in the SB-220/221 are both examples of this, I believe. Some chokes, however, were designed in the old (pre-WARC) days, and happen to have one or more resonance parked between the higher HF bands, say at or near 18 or 24MHz. If you try to use an amp with such a choke on a WARC band and it happens to fall near one of the choke resonances, high RF current passes through the choke to ground and the choke fries. In addition, it is equally possible that someone could have such an incident and then rewind the choke so it even has resonances that fall in one of the traditional higher bands (20/15/10.) The answer to both problems would be to

get a dip meter and check the new choke for resonances
while it is mounted in place and with a temporary short across
it. I have seen some good descriptions of this simple procedure
in an ARRL publication somewhere. An exact replacement choke
should be carefully checked for any resonances on 17 or 12
meters before operation is attempted there, and a field-rewound
choke should be checked at every HF frequency. The homebrew
choke, even if an exact duplicate of the factory choke, could have
very different electrical characteristics due to a difference in
the insulation film on the wire, winding technique, etc. Of course,
the grid-dipper check of the plate RFC is performed with the amp
off, unplugged, and the HV supply fully discharged! 73, David

Subject: Short range video tx

Hello Robert.
900 mc is shared by the hams with non-hams. Go get a Rabbit video
transmitter/reciever set. These are used to transmitte signals from a
vcr, cable box, or satelite dish down converter to tv recievers equiped
with the companion reciever.
Put a set of beams for this band on the roofs of the houses &
have at it.
If you use these things stock right out of the box, no one will
be the wiser or even care. You might want to put a pre-amp in line from
the beam to the 900 mc reciever.
I am sorry that you got a bad impression of ham radio, but
transmitting on the uhf ham band without the proper license is a no no.
You didn't do anything wrong, all you did was ask a simple question.
These guys didn't understand what you wanted to do or why. You asked the
wrong question at first, but now you asked the right one.
I hope that in the future you will get a license & join us.
Don't worry about everything people say.
Let me know how it works out for you.

From: ka9jwx@juno.COM (PAUL L WEBSTER)
Subject: Used cell phones.

Hello Joe.
Yes there are places where you can buy used cell phones that are
not hot-at ham fests. I bought an NEC 3 watt cell phone, several adapters

for power & antenna connections, & a power supply for $10 at Dayton Hamvention 97.
I went to Ameritech & got pickup & go Cellular service for a $35 activation fee & got 30 or so minutes free. I went back & got 54 more Minutes for $30.
I use the phone in the car with the flexible antenna on it. The phone hangs by it's handle on my console gear shift in my 85 Pontiac 6000. I plan to put a 5db antenna on the roof of the car for the phone latter to extend its range.
I live in the NorthWest Indiana area & have pretty good performance out my phone where its at, but an outside antenna will take care of the areas that give me trouble as far as acessing the cell sights. I have cell phone coverage from Wisconsin to about SouthBend Indiana.
911 calls (they are *999 on a cell phone like mine) are free. I know because thats what the Ameritech people told me besides after my phone ran out of airtime, I called the police using *999 & got through.
You don't have to buy air time, but why not. The airtime is good for 60 days & believe me, you can use that up & get your moneys worth without trying, so its not a waste. It helps to be able to call a friend on the phone from the car to get directions to his place or to let someone know that you will be late or early. Also other people can reach you in case a loved one or close friend is sick or hurt. Add a basic pager for more versitility.
Primeco has a better deal then the one that I got but they don't have as big a coverage area as I got. I picked Ameritech because my friend who knows more about this stuff than I do said he wasn't too happy with CellOne audio quality.
If you don't buy air time with a carrier, you will be using the same carrier that the last owner had & you may not like that co.
Eventualy, all this stuff will have to be digital to be compatible but for now my used analog NEC is it. Its a good supplement to my ham mobile rigs.
Good luck in what ever you decide to go with.

Subject: Use of silver cleaning dip to clean electronic parts?

I use Tarnex to clean silver plated parts. The silver sulfide is reduced and sulfur dioxide is released.(smells like rotten eggs)
I have not heard of the ten second rule. My guess is that if some dissimilar metals are involved say due to soldering or brazing, there may be some electrolytic action that might produce some corrosion products or discoloration if allowed to sit in the solution too long. Be sure to rinse parts well after the treatment.

: I'm baffled by the behavior of my radio, a TS520. If I'm
: feeding cw into a dummy load, it shows ~ 250W output (it's
: specs say 200W output). When I switch to my antenna (a 135-ft
: dipole, fed by ladder line, with an MFJ ant tuner in the shack)
: the power meter on the tuner reads only 75W. The SWR on the
: ant is 1.1:1, so I can't see why the power would drop as it
: does. What am I missing?

Have you checked the VSWR of the dummy load? If it is high, then
you will get a higher forward reading, as well as a higher reverse
power reading.

The radio only has 160 watts INPUT on CW, and 200 watts PEP input.

I have been seeing a new antenna by Cushcraft advertised in some of the catalogs called the A3SDX, but all I can find out is that it costs on the average about 100$ more than the A3S and that it covers the same bands.

Does anyone have any specifications on this antenna?

Bill,

I have four (4) DR-150T's and like them. I liked the very first one
and then decided to standardize on that model when I started trading
and buying new cars. There are three Hams in my family so thats why
there are so many. The DR-150T does everything I want and performs
very well. Easy to program , 50 memories, etc. There are a few "Bells
& Whistles" on the unit I do not use, but isn't that the case any
more? I am sure there are other makes and models that are equally
as good and a few dollars less, but I found a winner and stopped
there.

THE RCI FEDERATION ANNOUNCES
##################################

RCI-ROM 1.1
A CD-ROM for RCI 2950, 2970, 2980, 2990, Saturn, Satutn Turbo and similar rigs owners.

All the mods well explained with texts, photos and videos
No a simple listing of Howtoos but a real multimedia product with menus, musics, sounds...

Multimedia part:

Enhanced & re-written user's Manual with un-published tricks
Full Diagram: Main Board + CPU board + Microphone Encyclopedia
Full listing of all the components
Full table of voltage values
Full table of frequencies - channels
Full alignment procedures
Repair tricks, errors, enhancements...
Plenty of mods with photos, videos, voice explanation....
Extreme mods "for transverting to other bands" chapter
A full DX Guide with beaming utilities & programs
A Rci Packet chapter: How to practice Packet with your rig
A complete information on the RCI Federation, the full collection of already published RCI Newsletter...
The RCI BIBLE 3.0 beta (exclusive)
+ Over 1500 mods for other rigs (Ham and CB radios)

Video part

Component section ID
Internal Controls ID
Channel conversion on new 2950, my old one got stolen.
MRF477 intro and removal of 2SC2312's
MRF477 pin reconfiguration.
MRF477's installed and AMC transistor location.
Observing the radios output on a scope and wattmeter.
Introduction of the Heavy swing modification.
Candlewax (just watch it!)
Observing the effects of the swing kit modification on the
Wattmeter and scope.

Disassembly of the radio.

and much, much more.....

The needed computer will be:
486DX2, Pentium, Pentium Pro, or any other compatible
RAM: Minimum 8 Mb - Hard Drive: 20 Mb free on the disk
Video: 800x600 VGA or upper
A CD-ROM reader 4X & a SoundCard
Everything is in English.

Price: $35
- Credit card Visa/Master Card
- Cash
- Mail orders
- Resellers and importers, please contact for other payment protocols.

Date of release: 30 October 1997.
We directly deliver 96 Hours in any country and we are looking for local resellers or importers. Please advise.

There is a beta version available at our web site: http://rciweb.cadic.com (9 Mb in a EXE autodecompressing file).
This CD-ROM is the product of an international collaboration (France - USA - UK)

---------- PRICE REDUCED! ----------

Hello,

I have 2 Hewlett-Packard 331A Audio Distortion Analyzers for sale. They measure total distortion from 0.1% to 100% full scale in 7 ranges, from 5HZ to 600kHz. Harmonics are indicated up to 3MHz. Measures noise as low as 25uV, voltages from 300uV to 300V RMS full scale.

They are both in excellent condition, recently calibrated, 100% operational. They both have option 01, which allows for DC operation from a 26-30VDC source. One has the rack mount brackets, the other does not.

Asking $120.00 each. You pay shipping.

Contact Jack, at parmentier@mindspring.com or call
Home - (919) 387-8109
Work - (919) 472-7814

Back in the ancient days of ham radio, a quick and dirty method was to put the rig on the upper end of ten meters into a dummy load. Adjust the neutralizing capacitor a little each time to get the plate current dip to coincide with max output. The pefered method involves removing screen voltage to make adjustments. Think safety first and don't get killed in the high voltage section. Remember .... neutralizing caps hve high voltage accross them so use an insulated screw driver !!!! I think there is a section in the owners manual concerning proper neutralization method.

They DO have it posted on the ICOM Japan web site, albeit with all text in Japanese.

The easiest way I know to gather up a sizeable portion of the info that has been bouncing around the Internet on this topic is to surf to: http://www.dejanews.com
and then do a search on "IC746" or "IC-746". I came up with over 40 hits the last time I did a search there.

It looks like a nice product somewhat between the 706 and the 756. The only disappointing spec I've seen on it so far is that the receive coverage is not continuous through 200 MHz like the 706 -- it appears to stop at 30 MHz, and then JUST cover the 6M and 2M bands. What a shame, in my opinion! Happy hunting.

946. TM-V7 vs FT8000

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-13 00:00:00 UTC
From: jeffcav@hotmail.com
Message-ID: <34432768.984154@news.tiac.net>
Source record: 164050

I recently bought a TM-V7A. I find that at the competitive price of five hundred dollars, the radio exceeds in performance all the other choices of it's class.

I would recommend this radio to any Ham interested in a 2m 70cm transciever. I have found few problems. Some include when you turn on the microphone control feature, the DTSS and other minor things do not function. However, I think that if you buy this radio, you will find that the quirks are both minor, and under normal operations, are hardly noticeable. The radio has unbelievable sensitivity, but also good rejection to noises such as alternator whine and intermod. In the event of intermod, there is always the possibility of turning on the AIP, fancy name for an attenuator.

There was someone asking about the Simplex checker. I tried it once, but was rather disappointed. The checker, while monitoring the repeater, will switch back and forth to the input frequency. This causes the repeater to be muted for about one half second, every 3 seconds or so.

There was a mod for this radio posted on this group. When I tried it, I found that it was wrong. Apparently, the message explained it correctly at the top of the page, but when the diagram was made, the wrong jumper pad was pointed out.

The correct mod is as follows:

Remove the display and flip the radio over. Remove the four bottom screws. Put the back the radio towards you. Look directly forward over the top of the bottom of the radio. Thereis a board that sticks up in the upper right corner. It has six or seven jumper pads numbered from 0 to whatever. There are 2, 0 ohm resistors on pads one and 0. Remove jumper zero. Now all pads should be cleared except # 1. Do a full CPU reset by first punching in the reset button behind the display cradle. Then do the software reset while turning on the radio by holding down the MR button while turning on the radio, then press it again when prompted to do so by the radio. Don't forget to disconnect the power before opening the case. This mod will get you the extended TX, but not the 800 - 1000 RX.

73's and good luck. I hope this answered some questions.

Mike, ;you are in luck. I would suggest, since you are already
living in the Denver area, to go to Ham Radio Outlet, (8400 E. Iliff
Ave) and take a first hand look at the radios you have mentioned and
others. Talk with the staff and ask all the questions you want.
Take a tape measure along so you can measure the actual radio and see
if it will fit in your car etc. They have several working display
models for people to try. They are a super friendly bunch and I
tend to trust their opions. They also get alot of feedback (pro vs
con) from customers and that should help you tremendously.

Give that a try

For good intermod performance and removability, you might consider these
alternative strategies:

1. Old Gear
For City use, I'm quite fond of my 70's vintage Midland 2m mobile.
It has helical cans built in. When I'm on the flyover ramp on our
"Southeast Distressway" next to the police dispatch tower in site of
downtown Pager-land -- Intermod alley -- it's clear, while the scanner
goes crazy. It doesn't have all the bells and whistles -- its memories
are in my head; although it's digital frequency entry to control the
pll, they're dialed in not keypad; Tones were added onto it
aftermarket, I need to bring that control out to the front panel
someday -- it is made of discrete parts assembled into a rational
block-diagram that I'd have a hope of repairing. And it was pretty
reasonably priced at the hamfest too. I forget if I paid a hundred or
a buck-and-a-half. Once I get it's grounding and isolation right, I'll
be able to run 25W with it, but currently 5W into NMO 5/8 on a metal
truck roof has all the range I need. I take it in the house at night
and park it under the seat during the day, since I know the hard-way my
driveway is high crime.

2. RS HTX-202 + Amp/PreAmp with helical cans

The HTX-202 has NO extended recieve; it's very tight front end is
almost intermod proof by itself.

The better mobile-amps are equiped with helical filters (mini-cans)
that protect their preamps from the pagers (and also keep the Amp
clean). These should protect less tight HTs from intermod, but
with the HTX-202, nothing. Or you could get an amp with
straight-through receive for the 202. (Heck, just hooking the HTX-202 to
13.8V and an external antenna give you 5W mobile, provided you leave the
belt-clip heat-sink in place -- that's enough for city work.)

Combining an HT and an underdash amp, you get the equivalent of
removable face/control with the added advantage that the removable
component is usable separately.

MAHA has an Amp that includes support for HT and
powersupply mating etc, might be interesting. Not sure if it's rigged
for 13.8V or not.

There is a device called a "Select-a-tenna" manufactured by
Intensitronics Corp. P.O. Box 562, Hales Corners, Wisc. 53130. You can
simply set this device next to almost any AM radio, no wires, no plug in,
no batteries, tune it to the AM frequency you want and the signal is
amplified about 5 or 6 times. This device is somewhat odd in appearance.
It is a round disc shaped unit, about 12" in diatmeter and about 2-3"
thick and it sits upright. You just set it next to your AM radio, tune
it to the frequency and you will hear stations you couldn't even pick up,
just like they are local. I have one and it works. I have seen them
advertised in various mail order houses such as Herrington and perhaps
Sharper Image. They cost around $60.

Subject: FT-50R ANTENNAS

I haven't picked one up yet, but I intend to. I think it is Comet that makes a 1 3/4 inch SMA antenna that will work on the FT-50. I spotted it in a recent HRO add in QST. It should sell for around $30. Even if it is just a little air cooled dummy load, it should work for repeaters and simplex work that is not too distant.

Have fun,

Bruce Barnes

Subject: Kenwood TM261A

Hi
I recently purchased a Kenwood TM261A here in New Zealand. I had read the information on the rig on the Kenwood USA www page before buying it. I live near to the Auckland International Airport and one of the things I liked about this rig was that it could be tuned to listen to aircraft on VHF. I rang the local agents and they verified that this was so and so I went and bought it. On getting it home I found that it only went down as far as the top of the aircraft band and not on AM. I rang the agents back and they apologised saying they thought that it was the same as the more expensive model, and that obviously the NZ sets are

different to the ones made for USA. I can't afford the more expensive model so I would like to know if anyone can help me with a modification for my set to make it perform the same as the ones made for the USA market.

Any help would be apprecieted.

Regards

Jim I can't agree with you more. As a consumer, I appreciate the choices we have in the HAM gear marketplace. I wish you luck in your future purchases.

Could you elaborate more as to why the 1000MP is not even on your wish list? Sorry it is off the topic but I can't help to ask such a silly question.

Best 73!

Subject: time & GPS vs UTC

I belive GPS time and UTC time are different because GPS time is based upon an astronomical/celestial scale (UT1, which is based upon the rotation of the earth, versus UTC time which is based upon atomic time. Anyone know for sure?

Here's what I found from NIST (http://www.bldrdoc.gov/timefreq/faq/q6.htm):

Occasional leap seconds are introduced into the UTC time system by international agreement for keeping the atomic-based time scale in approximate agreement with the astronomical time scale, UT1, which is based on the rotation of the earth. Even though the atomic UTC time scale is much more uniform than the UT1 scale, some users must work with earth-based time. For example, boaters navigating by using celestial navigation, need to know the UT1 time of their observations. Since only UTC time is normally broadcast by time-and-frequency radio stations such as WWV, the broadcasters agreed to occasionally adjust UTC time in steps of exactly 1 second so that the difference between UTC and UT1 would never exceed 0.9 seconds. Thus, celestial navigators could then use the received UTC signals and know that any errors with respect to UT1 would be less than 1 second. Leap seconds have been inserted as needed into the UTC time scale since 1972 at average intervals slightly longer than one year.

How often do leap seconds occur?

This depends on the difference in rate between atomic clocks and the earth's rotation and how this difference varies over long periods of time. Since the start of the new UTC system in 1972, about 20 leap seconds have been inserted as of 1995.

Is Coordinated Universal Time (UTC) the same thing as Greenwich Mean Time (GMT)?

Greenwich Mean Time (GMT) is a 24 hour astronomical time system based on the local time at Greenwich, England. GMT can be considered equivalent to Coordinated Universal Time (UTC) when fractions of a second are not important. However, by international agreement, the term UTC is recommended for all general timekeeping applications, and use of the term GMT is discouraged.

From: davem@cs.ubc.ca (Dave Martindale)
Subject: Experiences with Astron switching power supplies

I see that Astron has a line of switching power supplies designed for powering communications gear. Of course, it will be much smaller and lighter than the equivalent linear power supply, a feature that I would be fond of.

However, I wonder about noise (various kinds). Would anyone who has used one of these Astron supplies comment on:

- does the little fan run all the time, or only when the temperature inside the case or on the heatsink gets high enough? (I.e. if I'm powering a transceiver that sits using 100 mA during receive, will the fan run all the time anyway, or will it kick in only when I've been transmitting for a while?)

- does the supply make any audible high-frequency noise

- Is the output electrically well filtered enough that it doesn't add any noise to the transmitted audio or RF?

Dave

: If the freq's in band A and B are the same, or I operate V+U, there is no
: problem.

Paul,

You will not be able to receive on one VHF frequency while transmitting
on another, since the radio attenuates or blocks the remaining receiver
when transmitting on the other side (in V+V or U+U).

I've never had a problem *transmitting* in V+V or U+U, no matter what
frequencies I've used. I'll try your test today...

: > I used a straight key untill I got to 13 WPM, and now I use a
: > Bencher iambic paddle. You must adapt to the new key but it doesn't
: > take long.

: I agree, for some, that method might be better. Maybe even for most people. I
: learned code myself too and was able to pick up the correct cadence very well from
: using an Iambic paddle from when I first used it. I now use both a straight key
: and an iambic. It just seems hard for me to understand how you would get any kind
: of feel for how the code is really supposed to sound if you are using a straight

: key. I feel that I send very good code, which is irrelevant, except that I
: apparently learned opposite from the way the "experts" say. I respect both of
: your opinions, and, I guess, for a lot of people you are probably right.
: However, I think the "Iambic first" method will also work for many other people
: besides me.

: Also, in my practicing to get up to 20 wpm a couple of years ago. I spent quite a
: bit of time on a qso simulator on the pc. I used a both a straight key and an
: iambic keyer. This is a very good way to get closer to technically perfect code
: as the computer is very picky about your code. At least mine was. Maybe they
: have more forgiving software now, but that "pickieness" helped me. Whad does
: anyone think about that? Anyone else use these sims on the computer?

: 73's de N7HM

I also used a computer software to learn CW. And maybe you think you
didn't need to start with a sraight key but you have used it after
and that has perhaps helped you to get the felling of the timing.
The fact that the straight key permits you to extend the dahs more
easily wich helps you in the beginnig !
Anyway, if already have a good transmition, you don't have to worry
anymore hi hi hi !

Subject: Need opinion on Satellite Ham equipment

Hello,
I'm wanting to get involved in working the satellites. I realize there
are quite a number of ways you can configure equipment to start working
them. Since I want to work some of the GHz bands, I realize I will need
to probably get transverters and or some combination of transceivers.
I've read about people using 2 meters, 70 cm, and 10 meter rigs with
transverters. Is there an advantage of using one band over another? Is
there a preferred combination (2 2-meters, 2 meter/70 cm, 10 meter/##)?
I've heard it is best to have all mode rigs.
Is there any advantage to using a dual band radio (IC-821H, FT-736) or
single band all modes?? Is one manufacturer considered better than
another??

Thanks in advance,

Roger KB9LBU

Subject: ts940 warc enable?

I have a ts940 that will transmit on 30mtrs but not on the other warc bands.
Anyone know how to enable them?

cheers, Paul

>The HTX-202 typically goes for around $100, +/- depending
>on condition. It has no out-of-band mods so it's less desirable,

Less desirable for whom? If someone wants to xmit out-of-band, let
them do so legally with a radio designed for those frequencies (assuming
they're licensed to xmit on such frequencies).

>The HTX-100 is a REAL nice radio and is a bargain -- but without
>FM and CB-ability (AM, LSB) like the Uniden, it's less desirable.

Less desirable because it doesn't have "CB-ability"? I'll bet you cheat
on your income taxes, too...

This whole business of "private conversations" on "public" airwaves is
no different than holding a "private conversation" in a crowded room
with both parties shouting at each other from opposites sides of that
room. Silly, in the extreme. How dare the other OCCUPANTS listen!
And then, add the "lawmakers" and "money makers" to the brew.. Thou
shalt not listen to private conversations on public airwaves. It is
insane!!!
The solution is a technical one. The manufacturers can make secure
systems, but IMHO fear a public backlash at the cost. Sheesh. Is there
no end?

Dick

>73 Lawrence KC5SGE

This is somewhat analagous to the Cellular Telephone industry. They
went ahead and designed a system with NO privacy protection and then
bought spectrum, laws and congressman to make something we all thought
was a protected right (monitoring the public airwaves) a crime, simply
so that they can sell a commercial service and be able to tell the
customer it is safe (at least illegal) with a straight face.

The design of the internet has no safeguards to protect anyone from
the use of dead-end and fictitous return addresses. I fear that any
"band-aid" solution that might be employed will just make it harder on
honest citizens while not really solving the underlying problem, just
like the ongoing Cellular Telephone debacle.

Soon, scanners and monitoring will be outlawed by senators and
congressman who don't have any clue (except that fat CTIA paycheck).
In a world that tolerates and even encourages such blatantly
unconscienable activities, can restricted amateur radio and personal
Internet access be far behind?

IMHO

Steve

Greetings,
I have a Kenwood TS-820S with digital display available for sale. It is
in near-mint condition and comes with the hard-to-find KB-1 heavyweight tuning
knob, a spare set of finals, plus BOTH the owner and service manuals,
including the original box (I'm the original owner).. The RF amp has been
replaced with a MOSFET for improved sensitivity and IMD performance.
Price?...I'll let this cream puff go for $375 plus split cost of shipping.
I also have available the following accessories:
R-820 - RARE companion receiver
AT-230 - Antenna tuner
MC-50 - Microphone
SP-820 - External speaker w/filters
If interested, I can be reached at W9SDA@aol.com or most evenings after
7pm CDT at 414-547-5116.
Best Regards,
Ronn - WA9SDA

Watch for the voltage drop across each resistor exceeding its dielectric rating. Regular resistors are rated at 200 or 300 volts, metal glazed can be 3kv DC. To stay within device ratings, it might become cost effective to use HV resistors- even at 22megs each. The I^2*r gets troublesome at those voltages, so be sure to factor in dissipation.

I am looking for a UHF FM radio capable of transmitting simplex
at frequency of 464.675 and 464.425 mhz. It must encode a PL
of 118.8 hz.

This radio is going to be used LEGALLY under the terms of the
FCC license granted to my employer. I wish to purchase one
because the company-issued models work poorly.

Please respond directly to w9vi@mail.com

Thanks in advance.

Yes, the Comet SMA-3 performs the best on the FT-50R Yaesu hand held. Its about 3 inches longer and I consider it to be big and bulky. I am perfectly satisfied with the ICOM FA-S270A antenna which is about 2-3 inches shorter than the factory anntenna and also does not perform quite as well as the factory antenna, but its much more portable. Great for local coverage. Much better than the little tiny 1" stubby Comet that is more or less like a dummy load. You may email back for more questions if you would like. Good luck

I am currently out of work and am forced to sell some stuff to pay
bills. Here is my list. All equipment works 100% and is in either
brand new condition or dam close. Prices are firm and you pay shipping.

Radio Shack PRO-62 with brand new NiCad rechargable
batteries, antenna & AC wall charger/adapter. This hand held scanner
receives:
30-50, 118-174, 380-512, 806-823.9875, 849.0125-868.9875, 894.0125-960
this radio has not been modified. It is in excellent condition and has
only been used indoors as a base scanner. 8 months old paid $299+6%
sales tax.
FS: @ $175

Motorola SP-50 Hand Held UHF 2Channel - with 1 battery, antenna & drop
in rapid charger with slow charge option. This radio is in brand new
condition
and is less than 4 months old. It is currently programmed for 2
channels in the 460Mhz band. I paid $389+$49 for the rapid charger.

974. Air Travel With Kenwood 870

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-14 00:00:00 UTC
From: nitz@selectsa.com
Message-ID: <6205vd$8ak@clarknet.clark.net>
Source record: 163879

Just a quick thank you to those that responded to this post in August.

Here's what I've learned about air travel with a large ham radio:

1. There are plenty of suitcases that are designed as sturdy carry-on bags which will fit the Kenwood 870, with the 'packing' materials, plus have enough left over room for some clothes, a G5RV, etc. I used a 'gym' bag as a carry-on, but next time I'm going for a real suitcase...one with wheels and a handle.

2. The airport people are MUCH nicer than the 800 number (i.e. official airline policy...if it can't be turned on...it must be checked baggage) would suggest.

I was up front with each person at both sides of my Baltimore - Denver - Salt Lake flight. I was polite, friendly and Told them I had a 'radio' in the bag. They had me pass it each time through the X-ray machine, one time they actually looked at it, one time they didn't. At no point did anyone insist that it be turned on....they asked (once) and were satisfied when I let it go through X-ray.

3. Get to the airport EARLY so that you don't get on your plane late. And if you can do it, always take a direct flight. I almost missed my connecting flight and it was a comical sight running through the airport with a 35 pound gym bag without wheels. Had the plane been full, my radio would have never made it. The other backup plan would be to make sure that your suitcase could, if necessary, be squeezed under your seat.

4. Pack the radio carefully...your rig will shift in flight during takeoff and landing...plus you never know how gentle other passengers will be when 'shoving' their luggage on top of yours. My radio survived with clothing as packing material, but I wouldn't do that again...I was lucky.

I had an absolute blast operating as WX3B mobile 7 at the North Rim of the grand canyon in Arizona area over the past weekend. Would have been easier with an Icom 706 or Kenwood TS-50, but the 870 made an excellent 'portable' mobile rig. Thanks to all on 10 and 15 meters who made my radio expedition a success.

73 and thanks to all that helped,

Jim Nitzberg

I just got my no-code ticket. I'll be honest, the reason I finally got it was so I could carry a scanner in my car. I don't have any interest in scanning public service or cellular, but I listen to railroad frequencies to figure out where trains are comming from so I can photograph them. This means I have to listen in the ~170 MHz range. Note - I said listen - I'm not going to do something stupid like TX out of my licensed authority.

I've read just about everything I could through Deja News (ergo the paranoia about posting about out-of 2M use), and have been trying to decide on an HT that can replace my Regency HX-1000 scanner that just bit the dust. Since I just got my ticket, I figure I might as well get a HT that will let me capitalize on my new authority, and maybe pick up a few new friends.

There are quite a few radios that seem to be able to meet my needs, not only 2m rigs that have expanded receive range, but some dual-banders that may make my new HAM experience that much better. I have no idea yet what the activity in my area is on 70cm, though - I go to the local club's meeting this Thurs for the first time.

In comparing HTs, I've kind of settled on the ADI/Premier AT-600. I can justify the price over expanded range 2m HTs (even if there is no local 70cm activity), and it seems to be a good value. I've found quite a few happy owners postings, and the only negative comments have been generalities by those who don't own it (as in "stay away from ADI and Kenwood"). This is basically a "speak now, or forever hold your peace," and a last chance to say something you can refer to as a "I told you so."

Seriously, are there any concerns about this radio? Is it a radio you absolutely wouldn't want someone to have as his/her first radio? Am I completely off-track in my analysis?

I'll admit that the reputation of Yaesu and Icom had me looking at thier products first, but I've seen more nay-sayers about some of the radios from those companies than I have seen about ADI. It's inexpensive, and seems to have high buyer satisfaction.

I'm also kind of torn between the standard and HP version of this radio. ATI's web site doesn't give any differences in the specifications between the standard and HP. The price on the standard version ($40 less at Ham Radio Outlet (I'd love to shop at a local store, unfortunately, there aren't any)) is appealing, but I really don't know what I'd be giving up. Can someone fill me in?

Thanks in advance, and 73
- Arved

None of the Radio Shack units will work repeaters. If you really need repeater capabilitys, the Maxon GMRS 210+3 is probably the best dedicated GMRS handheld available.

I owned a pair of the PRS-101's. They work pretty good for general use, like flea markets, or short range moblie communications (car to car). My biggest complaint was the battery consumption seemed high for a 2 watt radio. You can run them in low power (900mW) which will help on batterys, but not much.

THe PRS-101's don't have any fancy features like scan. They also have no tone squelch. You program in your 1 or 2 main GMRS frequencys. The emergency channel and the 7 interstitial channels are pre-programmed.

For $59.95 new I think they are a good buy for a basic easy to use radio.

I have had great success, when wanting to know if I can use
my amateur radio in foreign countries, by simply calling the
appropriate embassy. They may not have the answer, but might
be willing to research a friendly question from a soon-to-be
visitor, or at least give you an address to the agency within
their government that regulates radio.

Hello, all.
I need some small, high-voltage relays to switch a a high voltage source between two different sets of outputs. I'm looking for something rated at least 1kV, and the current will be one amp at most. I need a total of four DPDT, or eight SPST, etc.

If anyone has these, or if anyone knows where I can get some surplus units, I would be VERY grateful!

PLEASE E-MAIL ME DIRECTLY AT george_reiswig@ccm.jf.intel.com, since I don't read these newsgroups regularly.

Thanks in advance.

Are you trying to store this frequency in the left or right side of the
radio? The reason I ask is that you *can* program UHF frequencies on
the left side, but it is primarily designed for VHF and has some limitations.
In particular, the second harmonic of the VHF VCO is used when tuning UHF
on the left side, and that limits the minimum step size that can be tuned.
There is a note about this in the manual.

Dave

Source record: 163889

My 551 died slowly. The display would not light on power up at times.

Turn it off and back on and it would work. Over a period of about a
year
it took more on/off cycles to get it to come on. The LO is not
working so
I guess there is a PLL problem. All the oscillators in the PLL are
operating. At times now when I power up a few digits may light but
the
tuning dial will not change the display. Most of the time the display
is
blank when powered. Someone suggested the cpu battery was dead but I
have
found no battery in the radio. All ideas and suggestions will be
appreciated. 73, Dexter W4DEX

Hi Everyone....

Need a little advise/education. There are two IFs that CW filters may be installed in a Kenwood TS-850S (455KHz and 8.8MHz) For example there are two 500 Hz filters available one for each IF, so which one should the filter go to? both? one or the other? Advantages/Disadvantages? Same for the 250Hz/270Hz filters? What is the best combination? Boy this can get confusing!

I already have the 1.8 SSB filter installed.

Please educate me on this!!!!!! Thanks!

Which model are you thinking about. The 1/4 sloper ? If so, I bought one about 10 years and would never do that again. If this is still the same model and it looks like it I could never get the SWR below 4:1. If this is the sloper where the feedpoint is up in the air (most likely) and you have to bring a wire from the feedpoint to a ground, it never ever seemed to work. I finally gave it to someone else and they didnt like it either.
Are you going to use this just to receive on or also transmit ?
I think they're alot better and cheaper antennas out there. The Alpha-Deltas look to be very expensive for what they are and aren't. I would consider a wire antenna from Van Gorden first. They have many wire antennas and the most expensive is $40.
If you are just going to use this to receive with just about any wire in the air will work much much cheaper than the Alpha will.
If you have an antenna tuner, even better.
I just noticed that you have call letters so I will assume you want to transmit, I would certainly try the Van Gorden first. If you wold like the different types and prices and lengths of them let me know. Also if your interested in building a wire antenna I can give you some ideas that I have used and that work very well for the low bands. Let me know and the size of your yard.

Hi Paul,

I assme you are speaking of the Kenwood '941 radio. I have one in my car and I really like it. I bought it more as a requirement of the mounting, rather than because I was in love with the radio. When I bought it 4 years ago, it was one of the few if only radios that allowed the mounting of the head away from the radio. I really only needed 2mtr and 440, but I bought the model with the 1200mhz module in it.

All told, I enjoy the radio, but then I am not "super ham" either. Just like having a radio in the car to talk to friends.

About the only way I know of Lawrence is to have all the postings go
through a moderator(s), in other words a "moderated" news group but
then that adds a form of censorship that others may not care for. In
extreme cases the offending post with all headers may be forwarded to
various "net abuse" committees or newsgroups but I'm sure they're
overwhelmed. There is some pending governmental action on spamming but
I believe that's concerning spamming one's e-mail address and not a
newsgroup. Even if someone's ISP is tracked down and a complaint sent
it may turn out to be someone like cyber-promotions.com which is
basically (I believe) a ISP/provider devoted to spammers anyway and
the complaint falls on deaf ears.(UUNET (I Believe) was notorious
about *NOT* responding to complaints of spam coming from some of their
members and recently they were threatend with (may actually have been
for a while) being cut off from the net because of their inaction to
complaints (that *GOT* their attention)) We're relatively lucky here,
some of the newsgroups I used to read have been almost *entirely*
taken over by spam and I read a short blurb the other day that the
spammers/junk e-mailers are (supposedly) trying to build/fund their
own backbone system so it may get even worse :(There is a group
devoted to eliminating spam (their name escapes me) and you might
choose your favorite search engine and do a search on "spam" for the
groups name, they also provide information on how to track down
spammers but most lately seem to be fairly well hidden and you could
spend an(hour(s) or so (as I have done) without much success.

1004. RCI 2950 or Uniden 2510 for 10 meters

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-14 00:00:00 UTC
From: ppasteur@h2net.net
Message-ID: <3444326e.60970982@XX207.126.101.77>
Source record: 163934

I am getting to ready to pick up a 10 Meter mobile rig.
Getting close to being able to pass test and code for
Technician plus. Want to have a reasonably priced mobile
radio for ten meter phone.
I have heard good things about the RCI 2950.. and some bad.
The radio has all of the feratures that I want. But the question
is are they reliable. People have said that they have had this machine for
years with no problems. Many others have said that they have problems,
even to the extent that some have to be serviced right out of the box,
before they will work.

I guess the 2510 is a real comparable radio. I noticed that it allows changing
the tuning steps, which I am not aware the 2950 does. I have not heard the
same type of negatives about it.

Has anyone used both radios that can compare them? If so what do you think?

How have you folks that have the 2950 been satisfied with the operation,
performance and reliability of your radios.

I am getting ready to buy something, so please help !!

Phil

From: Greg Dean <n9nwo@gte.net>
Message-ID: <61upt0$7nl$1@gte2.gte.net>
Source record: 163936

My local Radio Shack has three PRS-101 (19-901) for
$59.95 each. They also have one PRS-102 (19-902)
for $119.95. These are good prices. I believe that
the PRS-101 is a Midland radio and the PRS-102 is
made by Motorola. Both are 10 channel units.

I forget the discussion this NG had a month ago, but
do either of these units use the GMRS repeaters or
are they simplex only?

I am going to buy the three PRS-101 units as they will
due as much as most FRS radios. But does anyone have
any insight into what these units can do?

Paul,

I have the KW TM-742A. While I prefer the Yaesu FT-8000 for mobile use, I LOVE the KW as a base unit. The KW seemed prone to city intermod (S.E. FL), the Yaesu is much more resistant. But if you have a quiet spot at home you'll really like the KW. I wouldn't trade it as a base for any radio I've seen!

Source record: 163940
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

In my installation the AT's in my TS-440S and TS-570S can "digest" my G5RV ... the newer one more quickly. I've never tried it with the AT-180 that I use mobile with the 706MkII. My guess is that the AT-150 would do the job.

But it may depend on your installation (like how much coax between the tuner and the ladder line). So you might have to experiment a bit with the coax length.

Would like to hear from anyone who has had or has a QSK-5 or QSK-5PC working with either a AL1200 or AL1500 and what luck you've had. I am thinking on a new purchase of either the AL1200 w/QSK or the 1500 w/QSK since I enjoy both CW and the digital modes.

I've heard rumors about the QSK that bother me and I would appreciate hearing from users. I also welcome any comments on the AL1200 verses the AL1500.

snip
The Astron switching supply runs very quietly. the fan comes on with
temperature demands and does not run all the time. The supply does put out
birdies and on 160 meters it is pretty bad. I use mine on 75 meters through
10 meters and it works ok.

The Kenwood Tribander TM-742A is one of my favorite radios. If you live in a very large metropolitan city such as Miami, Fort Lauderdale, Atlanta, etc. You will hate the radio in the Mobile or as a base. Intermod sponge we call it. The radio is very easy to operate and program without the manual all the time. It looks great and very good sensitivity. The down side is intermod only. I have one for a base and I live near, not in Fort Lauderdale, but within 6 miles. I do not have this problem, but in the car when I drive through the heart of FTL, well it beeper, 800/900mhz bleedover, and all sorts of other undesired operation. Get 3 miles out of the area and Its fine. My Yaesu 8500 in the mobile is 99% intermod free. I only heard one quarter of a second of intermod in it in the same area during a full day in the car in that area. We did it for test purposes. I recommed the 742 if you don't live in this enviornment. If its the city you are in, get a Yaesu 8500 (dual bander). If you decide the 8500 route I have one for sale, check back to last weeks postings for details or email me.

Good luck

If that's what Newt's office told you, they're wrong. Doran is correct
that they plea bargained and settled with a $500 fine and no jail time.

1023. Re: vx-1r just shuts off

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-14 00:00:00 UTC
From: Andrew <andrew@tropicom.net>
Message-ID: <34438C38.E39C40B0@tropicom.net>
Source record: 163953

Well, I here that the radio power on button on some radios is very easily bumped and this causes your radio to turn on and or off by accident when you don't want it to do so. To test this theory, I suggest you put the radio on a desk and leave it on. Don't let the radio get accidently bumped and see if it shuts off. If it does, then your radio will most likely need repair, if it does not shut off, then, well, your problem is accidental bumping. I have this problem with my FT-50R. The power butten bumps my desk every so often shutting off the radio. I do not own a VX1R so I don't know how the power button is, but from what I am told this is a possiblility. When you try this, let me and others know your results. Good luck.

Source record: 163954

Hmm. Seems like I went though this about 2years ago with Yaesu and my radio. I spoke to Rod at RT systems (They make the programming software for the radio) He told me to set up the radio for splinter frequencies. Look in your manual for this setting or if you have the software, just change it there. That should solve your problem. Let me know how you make out. Good Luck.

Have near complete set of GE Progress Line (the 100% tube-kind from the 1960's) DataFiles for sale. Folders include - receivers, transmitters, controls, accessories, cabinets; set covers low, VHF and UHF bands. Will sell as set for $100 or $10 each plus UPS. All in good condition and complete.

Also have a few of the green books - system configurations, some up to an inch thick at $10 each and lower!

E-mail for phone information or verification of specific sets.

Also have low-low prog line strip set for 26-34 MHz if you want to make a 10M repeater - excellent condition with tubes intact.

Thanks for reading.

Anyone looking for a good belt holder at a reasonable price for the Yaesu VX-1R may want to consider the Max-Tac Beeper Holder sold by Brigade Quartermaster in Kennesaw, GA. The catalog number is MTB-42 and the price is $11.99 + S/H.

I have one and it works great. Much better than just using the belt clip that comes with the radio,

The order number for Brigade is 800-338-4327

I use one with my IC-706, and have not had any problems with noise.

The fan is temperature controlled.
It does come on once and a while when the rig is just sitting there in
recieve, but not very often. It does come on with a transmit load fairly
often though. Not loud enough to be anoying to me. The click of the
temperature switch is fairly loud when it clicks on.

I like the unit alot. It is very small and light.

As far as audible high frequency noise, I don't hear any, but my ears
are not as good as they used to be.

I have the smaller of the two units, 20A continuous, 25 intermittant duty.

wrote:

>I was thinking of buying an Icom IC-207H radio and would like to hear
>from owners or others that may be able to help me decide. Is this a good
>radio or should I be considering another dual bander???

I've only had a 207H for about three weeks now, but since no one else
has jumped in, let me give my impressions.

It's easy to program from the front panel. I've not tried the PC
programming.

The reports of the radio's sound are very good.

The dual band operation is very simple--once programmed into memory
there's distinction between bands, ie, no need to switch bands as you
move between memory locations holding 2m and 70cm frequencies.

There is no option to do cross band repeat or to monitor two
frequencies simultaneously. Scan modes are pretty varied, and I've not
really explored them.

The radio is very small; like most mobiles it gets good and hot during
long QSOs. The fan only runs during and a while after transmitting.
You can turn it on full time, but I'm not sure why you'd do that.

ICOM is offering a free extender cable right now, so you can mount the
front panel separately from the main radio body.

The squelch control doubles as an antenna attenuator for part of its
rotation. That's pretty convenient.

The speaker is small but plenty loud and clear in my truck.

Cost is about as low as it gets for a dual band mobile.

I like it--

Source record: 163815

FREE LIST: McMurdo Silver Material (c1930's)

*
If you are interested in McMurdo Silver, let me know!

I just picked up some nice old McMurdo Silver mail order ephemera, and I'll be sending out periodic announcements to those interested, when I put each lot up for sale.

Each lot comes complete in its original envelope, as sent to the prospective buyer (order form, price list, cover letter, etc.) back in the mid 30's.

I have six lots. They will not be auctioned. They will be sold on a first-come-first-serve basis.

By requesting to be on this McMurdo Silver list, you will receive only six email announcements regarding the McMurdo Silver material (one per lot), then you will receive no more, I will dump the list, and I won't bother you anymore (unless you request to be bothered).

Generally, these lots cover the Masterpiece II, Masterpiece IV, Masterpiece V, and the World Wide Nine. Some lots include copies of "The Silver Times."

Request to be on this list! If you're a McMurdo Silver buff, you won't want to miss it!

Thanks for reading. I'd like to buy a used U.S. Tower rasing fixture,
TRX-80HD, in good condition.
I can be reached at 315-677-5238 or e-mail at jskapiak@inficon.com

Thanks,

John K2SY

Hello!

Since many years I was looking for the GP300 service-software.
Now I try to find it over this posting.
So I hope someone who has the software is reading this and reply over
my eMail-adress on the top.
I am very pleased about any kind of info!

Thanx!

Max

HUM!!

I find this interesting, I have worked in what most people would call
HI POWER RF, 50 KV to 25MV systems, and I have never seen such a
value,ever. but if you really need a 1 tera value, try attaching some
leads to a chunk of glass. 1 tera ohm would be considerd infinate
resistance and glass would qualify for that. Most designs I have seen
use step down transformer submerged in oil with specail HT cables to
transport the ht around. You couldn't have open connections because the
HT would arch everywhere. This is a word from sombody who works with
the stuff everyday for a living.

I am in the same position, I work for the electric company and need to get one to operate on the 451 band. I have found by researching the web page www.qrz.com/mods that the easiest radio to modify is the Alinco DR series. Just have to cut 2 wires inside the control head. I believe the TX/RX opens up to approx 420-470 and 130-174. Remember IT IS ILLEGAL TO TRANSMIT OUT OF BAND WITHOUT PROPER AUTHORIZATION.

You might want to fire off an e-mail or call
W0GJ or K0IR. Both were on the expedition to
Heard Island. Either one should be able to
point you in the right direction. I did ask
K0IR about the Battle Creek Special at a
DX club meeting and he indicated that it
wasn't commercially available. Maybe you
can get the plans from the designers.

>
>I already have the 1.8 SSB filter installed.

Hi Bob,

I have the TS-450, so it may not be applicable.

It allows for a so-called SSB Narrow filter in the 8.83MHz IF. That
filter is the YK-88SN-1 and is a 1.8 kHz filter

It also allows for a so-called CW Crystal Filter in the 455 kHz IF.
That filter is the YG-455C-1/CN-1 and was designed for the TS-930S ,
TS-940, according to its spec sheet. It is actually a 250 Hz filter.

The installation notes in the TS-450 manual says that the display on
the unit will show 2.4 kHz and 500 Hz for the above filters but the
actual bandwidth will be 1.8 kHz and 250 Hz respectively.

I think Kenwood has made it very confusing. Furthermore, the CW
filter isn't worth a hoot, because in CW mode you are trying to copy a
station with the same audio tone frequency that you hear from your own
internal sidetone generator, and it doesn't work, because the incoming
signal is entirely out of the filter's passband if you offset by
enough to achieve the desired tone.

I have a couple of questions on all this myself. 1) Did HRO screw me
when they sold me that YG-455 filter? 2) How does Kenwood expecting
you to be able to use that filter on CW since it's centered as it is
(it should have been centered so that it produced a beat note at the
same audio frequency as the sidetone)?

If you get any better understanding of this, Bob, let me know.

Thanks,

73 de W9DMK

1062. Re: Repeater help.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-15 00:00:00 UTC
From: "Richard A. Ferguson" <raferguson@worldnet.att.net>
Message-ID: <623ljr$852@bgtnsc01.worldnet.att.net>
Source record: 163839

Suggested process for resolving repeater problems:

Check for desense. Using the local speaker, turn off
the transmitter, and listen to a weak station. Then
turn on the transmitter. If the change in signal is small,
desense is minimal, and you can look elsewhere for your
problem, such as the receiver. Most likely, the
transmitter is wiping out the receiver.
Desense is the most common and most difficult of
repeater problems.

If desense is detected, obtain the manuals and test
equipment, and very carefully tune the transmitter
and receiver per the specifications. A repeater
will not work unless the transmitter and receiver
are almost perfect. If you just tune it by ear,
the situation will go downhill fast.

If a careful tune does not resolve the problem,
put the transmitter on a spectrum analyzer.
If a problem is detected, retune the transmitter
while watching the spectum analyzer. Sometimes
you will put out less power, but get 100% of
it on the desired frequency.

You could replace the antenna with another antenna
or with a dummy load, to make sure that the
antenna, feedline, or adjacent metal do not
have rectification or other problems.

Finding desense and other repeater problems is
kind of a detective case, and requires a good
fundamental understanding of the repeater system,
some test equipment, and some trial and error.
This is very difficult, and sometimes requires
putting together a team of experts to study
and discuss the problem.

The last thing that I would do is touch
the duplexers; again, if you do not have
experience and good test equipment, you will
definitely make things worse. You could send
the duplexers to the manufacturer for a retune,
if you think that anyone has adjusted them.

Based on the questions that you are asking,
I suspect that you may not have sufficient
expertise to get a repeater working well,
so I recommend looking for local experts.
This is not a subject of shame; even the
experts sometimes look for help with
repeater problems. Two heads are better
than one.

An easy fix for this involves a 1/16 inch drill bit IN YOUR HAND,
__NOT__ IN A DRILL. By hand, drill through the plastic in the
Bottom Left most "hole" in the front of the case. This will solve
the low audio problem associated with this radio.

Of course. The cell phone is probably the most common element people can identify with. By claiming that this bill helps protect people from listening to your cell phone, you get a lot of otherwise ignorant-of-the-facts public on your side because, OBVIOUSLY, nobody buy a "peeping tom" would want to listen to someone's phone calls -- and (their rationale) "I KNOW *I* wouldn't want anyone listening to MY phone calls."

This is a tactic well known and used by many groups, especially groups like gun control advocates, who routinely parade "assault weapons" in front of the public as "cop killers" even though those classifications of guns are only responsible for 2.5% of the crime in the US during any given year. Same result from the public: "Well, I know *I* certainly wouldn't need one of those guns, so why does *HE* need one?"

> Peter/KA5COI

Peter, I hava a AOR900 Handheld scanner and I can hear BOTH sides of the conversation most of the time. It seems the closer the cell unit is to either the tower or my house it is possible. Don't quite understamd it. I find more and more channels with digital signals are becoming more common. It probably won't be long before they are all digital. My personal phone is in the digital mode and quite often it acts up and the conversation becomes unreadable. Hope this answers your question. Also listening to cell conversations is mostly innocent. How do I know who I am listening too??? Before the conversation gets too involved the link is passed to another tower and another frequency and I no longer can hear it. By the time I could possibly find it again it is over.

1068. Mr Webber N1PGW Sends Gear

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-15 00:00:00 UTC
From: "Short, B.K." <shortckt@primenet.com>
Message-ID: <34457FF8.4AE8@primenet.com>
Source record: 163845

Mr Webber N1PGW Sends Gear

Thanks to all who helped in getting my radio and speaker
from Harry A. Webber (N1PGW) of Dover Foxcroft, ME.

From email and phone calls from several people, it seems
that everyone who has dealt with Harry has had a similar
experience.

In my case, a Certified Letter to the Pisquatiquis County
Attorney did the trick in getting the radio shipped (he is
a county official).

Others, like me, have gotten their equipment from Harry
after being insistent and sending official letters to the
county officials.

In my case, the radio (FT-101ZD) does work and I'm pleased,
but the "matching" speaker is not the SP-901 (it is an SP-101).
I will live with the speaker misunderstanding.

It may be best to avoid dealing with Harry unless you are
very patient and insistent. Several people have had like
experiences and were quite helpful in providing addresses,
phone numbers, and the "technique" for getting the equipment
on the way.

It is over and I DID get my gear, but it WAS quite frustrating.

Just thought everyone should know that Mr. Webber DID send the
radio (finally).

73, Brian

Source record: 163846

Arved:

There are many excellent radios out there today for what you are wanting to do. For the money, I have the chosed the Yaesu FT-50R. It's costs about the same, but I have some reservations about a company that hasn't had a great deal of time in the Ham market. To be fair, I happen to know a couple people who DO had ADI stuff and they love it. The choice, of course, is yours....this is just my personal opinion.

The 50R is very user friendly and the mod to receive out of band was a cinch to do. All you need is a steady hand and a soldering pencil.

Hope I was of some help.

7-3,
Erv KB8TNQ

By the way, I'd be interested in six months as to how the ADI is holding up, should you decide to buy one.

What's amazing to me, is how one guy targets the cell phone end of the debate and that is what has fueled this round for some time. If you get an overview of the proposal, it is NOT just cell phones, but Police, Fire, Businesses, etc. which will become illegal to monitor.

If you own a mobile, HT or scanner that is capable of receiving these things, it will be illegal....and there is NO grandfathering on this one, if passed as written. The fact is, this could greatly harm the hobby, as many of us work with Police and Fire. Some groups work hand in hand with them.....take the group in Flint, MI for example. So your attacks on those "listening in" or "being nosey" are little more than a cheap shot at some hard working hams.

Wise up gang, we can lose a helluva lot here and I, for one, will not stand by while the parade passes. Write your representatives in Washington and tell them to forget this idea and protect Amateur Radio.

7-3,
Erv KB8TNQ

Hi Max,

Motorola software is available from Motorola for $350 per software package. No one that is sane will give you or sell you a copy. It is dangerous. Motorola enforces software copyright 10 times more aggressively than Microsoft. They have descended on some operations with federal marshals, local police, software engineers, attorneys etc. with a search warrant. Big time bad news. Best to just find a shop to program your unit for a reasonable fee. Good luck.

ya know, I think the Ford light truck wiper motor would be just about
the right size for that. Probably have to slow it down with a resistor,
though. Or, use two resistors and two momentary contact spdt switches.
One for "High Speed" and the other for "Low". Only problem now is
getting it on a mast!

Hope one of you guys can help me sort out my old WJ521A-7 rx.
The mains lead on the rear panel goes through a grommet into a sealed mains filter. This is made by Sprague with the numbers JN33-694B on the little tin filter housing.
Well, one of the feedthrough capacitors within this filter decided to blow and after having no joy searching the net for Sprague I'm pulling my hair out trying to put this set together.
I'd like to source either a complete Sprague filter housing c/w mains lead and filter or, as I've cleaned out all the gunge, a .01 @ 600v chassis mounting feedthrough, preferably two. Maybe someone has a scrap WJ rx?
Alternatively, does Sprague have a website, because Lycos and Excite can't find it!
All help appreciated, I hate non-working gear.

Source record: 163856

I have a GE Progress line repeater system with a set of Decibel products duplexers. The model of the duplexers are Db4048. The problem is this, the repeater works in receive for only a short distance, say a couple of miles. I had thougt the receiver was in trouble, but a signal generator placed across the room from the repeater is detected with out a problem. Yet when I get more then a couple of miles away the receiver indicates it is not getting a good enough signal and mutes the audio.

My question is this, do I need more duplexer cans? I have four, and the total supression accordding to Decibel products is -47 db. Is this enough for the progress line to do its job? The transmitter works fine, but the receiver does not.

I have done the front end peaking on the progress line receiver, each trimmer produces a noticible effect, and I beleive would not if the rf stage were dead. Anyone that can shed some light on this problem, offer some suggestions would be much appreciated

SHEESH!!!!

I was going to upgrade my license form novice to tech plus, but after looking at this newsgroup I am having second thoughts. I got my novice ticket over 10 years ago (renewed now) but never did anything with it. equipment too expensive, and after going to a couple of local ham club meetings with a friend of mine, all I saw at the meetings is a bunch of old farts arguing about stuff. According to all the books and articles I have read the ham community is supposed to be a FRIENDLY place. this newsgroup is NOT represinitive of that at all!!!. I never have done a lot of listening on the ham bands. But, if they fight like this on the air, I want no part of it!!! I'll save my money for a new computer or some decent home theater system. that way I can choose when I want to hear a fight!!!

Yep:

Still looking for that magic computer alien that can restore the firmware
status to my SP50. Somehow due to a encryption failure (can't imagine how)
the radio can only be read by RSS. One can no longer program data into
it. Other than that the radio works perfectly.

Tried all the common stuff as cloning, editing, reviewing the files for damage
ect. (and yes I have already tried the micro-wave oven trick)

I am tired of useing it to hold up my compter monitor, in a short while it will
become target practice by my 308. I would rather throw it away then send
it to /\/\. And to those who have not checked lately, they are now charging
between $150.00-$300.00 to repalce fuses in there star wars radios. What
a (FO) rip off. I knew I should have bought stock in /\/\ in the 50's

Monty

No I don't think so but what I do is use a program called SPAMHATER
(free). It and Eudora Pro (for me) allows you to see all the headers
in email spam ... I don't know about newsreaders. I then post a reply
to all addresses. I have had several people kicked off their ISPs
because of the spam.

1088. Longest life battery pack wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-15 00:00:00 UTC
From: rushed@globaldialog.com
Message-ID: <344444e0.2087025@news.globaldialog.com>
Source record: 163901

I'm looking for the longest battery pack I can get that'll work on a Yaesu FT-411. Hopefully I could get a 5W output out of it, and run for a good bit longer than the standard equipment. I need this for long running during Civil Air Patrol missions. I normally carry a field pack with me, so running a power cord to a bag riding on my field gear isn't too much of a hassle, so long as it's worth the weight!

Anybody who's got an idea, please let me know!

1089. Vertical Antenna Opinions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-15 00:00:00 UTC
From: Richard Mudd <rickmudd@teleport.com>
Message-ID: <01bcd930$13a57780$b979a3ce@dad>
Source record: 163902

I am considering either the GAP Challenger DX or the cushcraft R7000+ for a vertical antenna. Any opinions would be much appreciated. My goal is to end up with the best vertical for the least amount of upkeep. I am trying to get rid of the miles of wire in the yard...

1097. Scanner, HT for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-15 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <876920948.2353@dejanews.com>
Source record: 163910

Hello,

I'm selling the following items so I can consolidate my HT and scanner
needs into a new HT with extended receive capabilities. Everything
that follows is in excellent condition, both in appearance and
electronically.

(1) Uniden Bearcat BC-200XLT 200-channel handheld scanner. Receives
all bands from 29.5 to 950 MHz, including the FULL 800-MHz band.
Includes case, charger and antenna. Excellent condition. Asking
$150.

(2) Realistic HTX-202 2-meter HT. Includes antenna, 6-AA cell battery
case, belt clip, and speaker mike (originally purchased separately).
Also INCLUDES Realistic 1-amp power supply which mates with jack on
top of HT for base use (also purchased separately). This HT has been
pampered -- it looks and works like new. Asking $150 for the system.

*** Blue Light Special -- All of the above for $275 firm! ***

Hello Robert,

Are you any relation to Ben Ezzell who wrote the book about Turbo C++
Progamming?

Sorry that you've been put off by the hams that you've met at the
club. I seldom go to Ham Club meetings, because I don't feel that they
are worth my time. However, if it weren't an hour drive, I might
re-consider - one a month isn't a lot of time.

Is it OK to repeat the old saw, "You get out of it what you put into
it"?

I've been a ham 50 years this coming March, and It's been my
experience that it's broad enough to satisfy anyone's interests. Yes,
you will find a lot of old f---s on the air - the lower in frequency
you go, the older they are. Generalizations like that aren't very
fair, nor are they accurate, but it does seem that the 2 meter crowd
talks a different language than I'm used to on 75 fone. CW and the
digital modes tend to mask age somewhat. But the bottom line is this -
you will find that "sharing" is a big part of ham radio, and so is
tinkering. If neither of those things interest you, then enjoy your
PC and your Home Theater equipment with our blessing.

Good luck, and 73

Bob

Hello everybody,
I recently purchase an Alinco DR-112. I noticed that it receives/transmits a little bit out of the frequency on the LCD. Which is the part (variable condenser) that I must tune?
Which is the part that must also tuned/replace, in order to get more power than the 25 Watts?
Thanks in advance to all. I'm asking these questions, for I have no manual.
Bye........

1110. Re: Experiences with Astron switching power supplies

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-16 00:00:00 UTC
From: k9sqg@aol.com
Message-ID: <19971016000900.UAA25343@ladder01.news.aol.com>
Source record: 163764

Switching supplies are basically designed for instances where wide input voltage range is desired, small size is desired, and/or light weight is desired. Since I don't need any of these attributes, I build my own linear regulated supplies. One has been in constant use, 24 hours a day, for almost 10 years straight without a failure. When a switching supply fails, e.g. won't oscillate, you have about 50-75 components to fault isolate as the cause. Unless there is some compelling reason for the switching supply, including "it's newer technology therefore I have to have it", then a linear supply might be a better choice. To each his own.

Yeah, I've thought of that, but I'm trying to do this on the cheap.
One reply suggested using a window crank motor from an automobile
junk yard (the kind of motor used for power windows). I might give
that a try.

1119. Re: Out of band mods

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-16 00:00:00 UTC
From: n8kjt@juno.COM
Message-ID: <19971016.000532.3286.1.n8kjt@juno.com>
Source record: 163773

Why is it that almost every time that someone asks a simple questian how to do something that some self appointed "policeman" has to criticize why they want to do that and how illegal it is?
It seems like the questian that brings the big shots out of hiding is when someone
asks how to do an out of band mod to a radio. There are legitimate reasons for
doing mods like this, receive or xmit. And they do not necessarily require illegal
transmission on unauthorized frequencies. For all we know, some homebrew transverters may require an input frequency that is just outside the amateur
bands. Or another use I have found for my Standard C-508A's out of band xmit is as an excellent signal generator when fed through an attenuator.

So when someone asks for some help, please don't jump all over the guy. Not everyone is planning on jamming their local FBI repeater.

>almost
> 10 years straight without a failure. When a switching supply fails, e.g.
> won't oscillate, you have about 50-75 components to fault isolate

AMEN to the nix on switching supplies. They are great as long as they are working. If you are not experienced in repairing them, they are a real pain. Give me linear power supplies if I am going to be the repairman. I know, I know . . . there's one in my computer. I also know it's MODULAR and EASY to change out. Does that tell you anything??????????

Regards,

Bill

I have been seeing a new antenna by Cushcraft advertised in some of the
>catalogs called the A3SDX

NQ4E replies...
The A3SDX is configured to break down into more but smaller components to facilitate easier shipping for travel / DXpeditions etc. I don't think there is any performance advantage. AES has them for @ $50 more than regular A3S. If your use is base QTH, I would see no need for the A3SDX. I love my A3S. 73 de Chris NQ4E>

Source record: 163783

I would not worry too much about interference with your vehicle. I have 2 scanners, one dual band remote mount 2m/70cm, a pentium laptop, GPS, and an HF all band radio mounted in my car and they don't give me any problems. Had them all in 4 different vehicles. ('82 200SX, '84 200SX, '88RX7, '97 4Runner). I would just wire like a pro. Here is what I do.

I have a 8ga. twin lead wire that goes directly from my cars battery positive and negative, all the way to the back hatch of my car where most of the equipment is mounted. Don't put any Xmitters mounted anywhere near your cars computer (your car most likely will have more than one so check with your auto dealers Head Mechanic). Don't run Xmit coax near these either. Keep away from airbag & antilock brake mechanisms. I have never had a problem and I recommend this technique as a precaution. Keep your antennas at the highest point of your vehicle. This keeps you and your car SAFER from RF. Remember to always transmit the lowest possible power nessy. as this is not only FCC rules, but it will keep the potential tumors from possible growing in you. RF in the human body, cannot be good for you, but has not been proven bad either so PRUDENT AVOIDANCE here.

You don't have to use 8ga wire, I did from past experiences. I have found that after several years, 4 to be exact, that my wires have corroded from the humidity in S.Florida and that caused me to have less flow of amps in my wire. A heavier gauage should buy me more time so I don't ever have to replace the power cable. This is just my findings and you may get other peoples input here too. I am in no way an expert, but I have lots of knowledge in wiring and RF as do most Hams.

Also use good quality coax that has plenty of sheilding, Don't spool up extra lengths, cut them to just 2-3 feet more than you need. Spooling up extra coax raises SWR and that means you have more RF inside your car than you need.

Oh and if you put a computer in your car like I did or a GPS for that matter. Make sure that you isolate with Capacitor Noise eliminators both your ham radio's and your GPS & Computer. or you might get unwanted noise on you Ham radio. I sometimes get feedback from my GPS from the active antenna that is very noisy. (this I am stuck with, but it only affects me on certain VHF freqs.)

If you have any more questions, feel free to email me and I will help.

Good Luck to all,

Andrew

Quite right. No point in jepardizing your employer's licence. A U16 or U400
might do the trick and can transmitt legally in th Ham Bands as well, if
you're looking for a dual purpose approach.

and now, I'm chiming in: (boing)
I haven't noticed a _BAD_ problem like this with my IC-T2A, which I bought at
HRO in Salem, NH in July. It is not super-sensitive to audio; I have to put it right next
to my mouth when I talk, and most reports say it sounds like what it is,
a speaker-mike. Is there any info stating how ICOM fixes this and exactly where
they put the mic in relation to the speaker? Couldn't one fix his own radio?
How can a ham be without his HT???

You should be advised that transmitting on the commercial frequencies, even though you are licensed to do so, requires that the equipment be FCC type accepted for that particular service. I seriously doubt in Alinco qualifies.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down,

then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

WEBER ELECTRONICS
PO BOX 212
5138 LAUREL LN
BROAD RUN, VA 20137
telephone (540) 347-7760

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

1147. Tektronix 547 help

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-16 00:00:00 UTC
From: Colin <csc@smartt.com>
Message-ID: <3445BEFA.5E8D@smartt.com>
Source record: 163801

I have a peculiar problem with a Tektronix model
547 oscilloscope.

When the B timebase is selected, the triggering works
perfectly well when the time / cm range is between
0.5 ms / cm to 0.1 us / cm.

When the time / cm range is between 0.1 ms / cm and
5 sec / cm, it the B timebase will not trigger and the
triggering level control has no effect at all.

The A time base works correctly on all range settings.

Would anyone be able to the most likely cause of the
problem?

Any help would be appreciated.

Colin

Hello Follow Hams,

The Fall cleaning is still going on. From my personal inventory comes the Kenwood TM-742A. Tri-Bander with Detachable Head. Radio has 2 meter and 440 bands in it and comes with the remote DTMF mic. I am the original owner and will let it go for $490 or best offer give or take. Those who know me from the flea markets know I keep my equipment in good condition.

Drop me a note or serious inquiries can also call me at my work number: 201-747-8595.

Will be willing to trade for a new Motorola Radius 16 pin 32 channel UHF high power and/or RIC for a repeater that I am building.

My first thought is Rx desense. With only -47db isolation, that would be were I look. For the repeaters I have in service, I try to maintain at least -70 isolation. On high profile systems, try to achieve about -90 or more isolation. And even with this much isolation, still use a Rx preamp, in the 15-16db gain range.

Message-ID: <34462207.F278EA3B@harborcom.net>
Source record: 163806

Greetings,
A friend of mine Don Howlett KA8FWT has a Bird model 43 for sale. Also along with it he has 11 different plugs to go with it. The meter and the plugs come with their own case. Both are in excellent condition. Don also has other items for sale also. Too numerous to write. Don is asking $350.00 for the meter and plugs. If interested, please call 440-354-8974 or E mail me. stu@harborcom.net.. I am relaying, because Don is not hooked up to the internet yet. Thanks in advance. 73, Stuart KB8VIY Plugs are as follows;
5w 200-500 mhz
5w 25-60 mhz
10w 100-250 mhz
10w 25-60 mhz
25w 100-250 mhz
25w 25-60 mhz
25w 200-500 mhz
100w 100-250 mhz (has 2 oh these)
250w 2-30 mhz
2500w 2-30 mhz

I have an ID-4001 Weather station that is inoperative. Some of the LED's

light up, but
I can seem to set the time, etc. on it. It looks great cosmetically. I
don't have any sensors
or documentation on it. I will take offers on it till October 25th and
let it go to the best
offer. I will confirm offers by return email. Send offers to:

kc4kin@geocities.com

Thanks,
Ricky

I'm looking for a 2m and 440 base and mobile... (also want compatible repeater and auto patch). Want to trade for my HF bundle? Here's what I have (sold/traded as bundle only)

-Kenwood HF SSB Transceiver (TS-180S) with 160, 80, 40, 20, 15, and 10m bands. WWV (10.0 MHz) SSB/CW/FSK, desktop mic (Kenwood MC-50), speaker (Kenwood SP 180), and power supply (Kenwood PS-30). Has D.F.C. memory unit upgrade.
-DenTron MT-3000A Antennae Tuner and DenTron linear amplifier MLA-2500B.
-Computer Patch Interface by (Advanced Elec Apps, Inc model CP-1)
-Hybrid Phone Patch (Heathkit HD-15)
-Beam antennae rotator (Alliance Dual Speed Control)
-Vibroplex key.
-Microlog Corp's ACT-1 TTY.

Every component works perfectly.

"H" as in High power. I do not know what either is rated at, but the "H"
designation has generally been for more output.

==========
I bought one at Dayton last May. The only problem I have had is that
I have a rather booming voice and the mike may be a little too
sensitive for me. I have gotten comments about it from members of my
local repeater club, but interestingly, have only gotten comments once
or twice from anyone else. There is no knob or menu option to reduce
mike gain. Icom does have a factory mod for the microphone to reduce
the gain by about 10 to 12 db, involving changing a resistor on the PC
Board in the mike. (By the way, the same mike is used in the IC-2710
and the same problem/mod applies to that radio as well.)

I sent the mike back to Icom for the mod about a week ago and
have not gotten it back yet.

Otherwise, I am pleased with this radio, and the price is not
bad. They should have included some way to adjust mike gain, however.

Ray, K1XV

Hello Russ!

Many thanks for your binary trash! I have to pay now DM 0,70 more to the German Telekom (3 minutes with 7 kbit/s over a distance of 50 km).

I'm running a local news server on my machine, that's why I have got ALL new news in this non-binary (I am right?) group, including your unreadable pictures.

Think of other countries in the world where the people have to pay much, much money for a simple phone call of about 10 minutes over 50 km distance.

Sounds like your duplexer is the problem. If you don't have your own spectrum analyzer, bring it to someone who can tune up your duplexer. Try it with separate tx and rx antennas with ALOT of vertical space between them. That will isolate the duplexer.

Good luck,
Bob

This is definitely possible, so there must be some problem with your connections. I use the Radio Shack 43-228A Telephone Recording Control, and plug the audio jack directly into the microphone input of my sound card.

You can't get there from here.

ERP is the ratio of signal strengths in the listening area relative to
a standard antenna. You convert that number of dB to a Multiplying
factor and multiply your power into the antenna by that multiplier.

At least that's the way I remember it.

Your input data does not include the antenna gain, which has to be a
factor.

If you want the formula for Effective Isotropic Radiated Power (EIRP),
it's on page 17-10 of the ARRL Antenna Book, 17th Ed.

It essentially does the same thing as I do, only differently.

Due to expense of the requirement to carry numerous panels ICOM has
started using the serial number plate for the model description.

There is a IC-2000,, it is NOT imported into North America as it is
only a 10 watt radio.

So by placing the " H " on the serial number plate ICOM can use the
very same front panel for both the IC-2000 and IC-2000H.

Actually John is half right, it depends upon the cell site, but not on the distance to the site. What matters is the "sidetone" or the ability of the site's electronics to null out the other side of the conversation on a two-wire circuit. It can also depend upon the quality of the phone being used by the landline caller. There are usually a couple of places where a two-wire hybrid-nulled line is switched to a four-wire transmit-receive line in a conversation. Cell sites are FM, and so the audio remains constant no matter what the signal strength is. And by the way, you're right...there really isn't anything to listen to. I heard them once when I was repairing a spectrum analyzer, and found it totally boring.

Dave

1178. FT-50R antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-17 00:00:00 UTC
From: Rudy Marcelletti <rudym@net-link.net>
Message-ID: <01bcdaef$35115ae0$76e531cf@rudym>
Source record: 163728

For you FT-50R users, these are the antennas and what I have found to work the best with my FT-50R:
Best is first.

Premier telescopic 36" antenna with sma/bnc adaptor
Larson helical 1/4 wave with sma/bnc (2 meters only)
Comet sma-3
Icom FA-1443B bnc antenna from my IC-32AT
Comet sma-503
Yaesu stock antenna
Comet Miracle Baby with sma/bnc adaptor
Comet sma-501 mini handy

By far, the most practical antenna is the Comet SMA-503 3 band handi. This antenna consists of a "bullet" shaped loading section about the size of a 400gr 45/70 bullet and a VERY thin and flexible whip about 7" long. Total length is just short of 9" and the antenna flexes real nice so you don't get poked in the side and you are not bothered by it when carring the radio in your vest pocket. I noticed a big improvement in out of ham band receive performance over the stock antenna.

I sent a letter to Comet with my first 501 and they replaced it with another. The new one is now VERY close in performance to the Miracle Baby with a bnc/sma adaptor. I think the adaptor adds just enough extra antenna length to make a slight difference, say one s unit mark or so, but not all the time. I mainly use the 501 when doing cross band repeat through my dual band mobile rig, or when I am in close proximity to the local repeaters.

I use a couple of "o" rings to fill in the gap around the connector that is filled with the skirt on the stock antenna. These don't work with the SMA-3 tho because it is very slim. I am looking for a thick piece of rubber to cut to fit as foam would absrb moisture.

These are my humble opinios and I hope they are helpful. This test was not done in any sientific manner--just had some time to kill in my tree stand after the deer left the area last weekend so a played around with all the antennas I have for my various radios and checked the signal received from three different weather channels.

>how does one calculate effective radiated power from the swr and known output power?

One doesn't. To calculate ERP you need to know your transmit output
power, the loss of the coax, and the gain of the antenna. This is easiest if
you express everything in db. For example, if your transmitter puts out
20 dbW (100 watts), your coax has a loss of 1.2 db, and your antenna
has a gain of 5.4 dbi, then your ERP is 20-1.2+5.4=26.6 dbW (457 watts).

Message-ID: <344792CA.256B@boeing.com>
Source record: 163739

Aaahhh, no. Effective Radiated Power (ERP) is the effective RADIATED
power (key word is radiated)of a station with respect to some standard
radiator. From your definition If I placed a 200 Watt 440mHz xmitter on
one side of a mountion and a receiver on the other I could have an ERP
of close to 0.

To caculate ERP you need:

Xmitter power (in dB)
losses to antenna (in dB)
antenna gain (in dB)

add up all the dB's. convert back to watts and that is your ERP.

So that same 200 Watt station feeding a 6dB gain antenna with 100 feet
of .75 hardline(loss=1db) would be:

23 -1 +6 = 28dBW

or 398 ERP

If you really want to get picky you need to include the Hight Above
Average Terrain (HAAT)

Hope this helps.

I used to have my clock turned off in my FT-530. Now, after a reset, I can't remember how to do it, and I can't find it in the manual. I'm talking about turning it off so that it doesn't show when the radio is off. As it is now, I don't see it when the rig is on, but it comes up when the rig is off. If you know the correct button sequence to get rid of it, please email me. Thanks.

That's true for an experienced Morse operator, Howie, but it isn't for one who has just learned 5 WPM Morse. 5 WPM Farnsworth sounds completely different from 5 WPM Morse. The tempo is completely different. That can be a major problem.

>The thing about morse code no matter who is giving the test is the
>ability of the applicant to hear it and understand the music involved. Not
>everyone can handle the morse code and that is not a macho man thing but
>rather fact. You either can understand the language or you have a great
>difficulty hearing it as a piece of music.

Ugh, it isn't a language, but you are right that people vary widely in their ability to decipher it. There may be some correlation with musical ability, but likely it involves some loosely related but separate mechanism in the brain, IE I know some folks with musical talent who still just can't get Morse, and I know a few who have no perceptable musical talent who can do Morse. I do think that some sense of rhythm and tempo is needed, and a bit of pitch discrimination is useful too in real world situations (as separate from a test situation where there are no competing tones). A natural talent *does* play a major role in Morse ability, whether that natural talent is strictly speaking musical or not.

>The tone can be a major problem
>for some applicants but if the VE doing the testing as I do has a knowledge
>of this by asking the applicants if the tone is ok, can adjust the tone for
>that applicants ear. There are no set rules in giving the exam as some
>would think. The law of the FCC lets that be with the VE doing the testing.

Right. Tone pitch can be whatever the applicant needs, or you can use a buzzer with no discernable pure note, or even a blinking light. But the FCC regulations *do* state that the test must be in Morse Code (or more precisely, in the International Code), and the element timings for that are specified by the CCIR. Farnsworth doesn't follow those CCIR specifications. So a 5 WPM test using Farnsworth timings isn't a test of 5 WPM Morse Code receiving ability.

Note, receiving Farnsworth Code may not be more *difficult* than receiving Morse Code. For some it may actually be easier. That's not the point. The

point here is twofold. First it isn't CCIR International Code, and second it makes a *big* difference which one you studied preparing for the 5 WPM exam. (At higher speeds, it probably doesn't make any real difference which is used.)

>

Gary, Oops! I think you meant to say the ERP is 20-1.2+5.4=24.2 dbW (263 watts). BTW, without being nitpicky, the effective radiated power (ERP) is calculated using the antenna gain in dBd. The effective isotropic radiated power (EIRP) is calculated using the antenna gain in dBi. Bill N3WK

I bought the same model radio about 3 or 4 weeks ago, and as soon as I got on the air, others reported my audio sounding like I had cotton stuffed around the mike, or that I was talking into the back of the unit. I returned the unit to the store where I purchased it (in Wilmington, NC), and upon initial testing, they found nothing wrong. However, upon receiving further complaints from other hams, I returned the radio and demanded it be fixed or replaced. The dealer said they were now aware of the problem (the dealer is also an authorized Icom repair center). He (the dealer) tried repositioning the mike, but to him, there was no improvement in audio. He felt it was either an incorrect value capacitor in the audio or something more serious. At the time of this posting, I am supposed to be receiving either my repaired radio or a replacement. We'll see.

In article , w2upX@itw.com says...
>Has anyone come up with a quick disconnect method such as some knob
>attachments, wing nuts, or similar?
Barry, I think you are going to have to spring for the MMB-60 which is Yaesu's nifty little $32 quick disconnect bracket. The bracket I'm using is from an old FT212. It seems to fit all Yaesu's and even an Icom I have. Other than that, maybe a wing nut on each side, one in front, the other in back, would be enough.

Saw that Omni VI+ test report in QST? Terrible third-order mod distortion from the TX, lots of out the box problems, image rejection way below design standards, and so on...

QST tried to stay nice but the conclusion was clear.

Actually learned something interesting from it: The Omni doesn't even have the first IF above 30 MHz. Sorry guys, you might swear by this kind of outdated stuff but I think it is just a waste of money.

Wonder what that new Kachina transceiver is like. Now THERE you have a product that looks like a new, refreshing, US made product , which Ten Tec should have designed a year ago!

No, I am NOT connected with Kachina.

Source record: 163754
Cross-posted to:
alt.home.repair,rec.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I'd like to use a 12v battery with a charger to power my rigs in my
basement "Ham" shack.
I need the setup to keep the battery safe, both preventing explosive fumes
from building up, and to properly charge and monitor the battery.
I'm thinking of putting the battery in either a plastic tool box that I can
lock (I have a very curious and versatile 2 year old) or in a small pet
carrier (I won't have to drill lots of holes for ventilation in the pet
carrier as I would in the tool box).

Questions:

1. What car, marine, etc. heavy duty battery is best?
Critical Specs
or
Specific Model

2. What battery charger should I use to prevent damage to the battery and
to keep it
properly and fully charged - without generating rf noise in the
process (and to
preferably have a reasonably accurate display of the battery
condition).
Critical Specs
or
Specific Model

Thanks for any help! DavidC

I remember traveling to FCC headquarters in Boston as a kid to take the test. There I was, small town kid in big bad Boston in the Headquarters of the FCC ... I was overwhelmed to start!

Then I go into a very hot and sterile room for the code test. The testing person barked out his instructions and started the code - as the code echoed off of the walls in a tone and tempo I had never heard on any test or monitored cw exchange I sat there and never moved my pencil ... disappointed doesn't begin to describe my feelings!

Ayuh, tone and tempo can be critical! I still believe that 20wpm from the start is the best way to learn - you have to learn sound-groups rather than translate individual characters (something one may do up to about 10wpm - which is why so many get stuck at 10wpm).

Sounds like the sound card input level may be too, high especially when used with the tape players internal amp, maybe try reducing the input level on the sound card, in win95 this can be done from the multimedia icon in control panel, also I know it sounds elementary but check the wire that you put in the sound card especially near the connector they get worn out quite a bit, other than that, I really can't offer much more help from here.

I have an RCA single receiver system, about a year old.
The dish is mounted at the 15' level on my tower. I run 100 watts on
all bands with no problems. I have, starting at the top, a Ringo for
2m, a 10 el. 2m beam, a TA-33. Beneath all these are two antennas, one
VHF/UHF for fringe (50-70 miles) television and one UHF for local TV.
All this can crank up from the 30 foot level to the 50 foot level. At
the 25 foot level is a trap inverted vee for 40 and 80. The only
interference I get is a little on some of the low VHF fringe stations.
No problems at all with the dish mounted about 10' from the 2m and HF
antennas. My feedlines DO NOT travel the same path. All TV goes around
the house to the other side where the cable entry point is, the Ham
stuff goes into a conduit at the base of the tower and goes into the ham
shack inside.

Good luck

Al K5TAN

1224. Heil Headset Connection details required? Help Please!

Newsgroup: rec.radio.amateur.equipment

What model 2001 ? 2001A, 2001B ,2001C, etc ? Definitely a 2001 series
and not a 2008C,D etc.. ?? Have you called Moto's test equipment
depot ? or tried to order the CRT thru them ? (1-800-422-4210)

Interestingly enough, the annual calibration , flat rate repairs
do not include any CRT repairs. If you care to get rid of this
unit, please indicate...I might be interested if the price is right
and it's the right model...

[...snip...]

I recently purchased a used Icom IC-W2A dual-bander and it seems to have a similar problem with bad audio pickup. I get comments much like you folks have been reporting for the IC-T2A.

Just before he sold it to me, the previous owner had sent the unit in to ICOM because of this and they said they had fixed it. I am able to use it if I put my mouth right over the speaker area when I transmit. Even then, I'm frequently told there's something wrong with my audio.

Does anyone know if this is due to the same or a similar design flaw? How would I find out if Icom now has a real fix for this problem on the IC-W2A? I'm thinking about sending it back in but I'd like to be able to point them at something rather than just paying for another imaginary repair.

Remove top cover--------see the red and blue wires peeking out from the front panel? Snip the red and you receive 430-512. Snip the blue and you transmit 138-165. You must reset the microprocessor!! You will lose all your stored memory. Enjoy!

Tim

Hi there!

I'm locking for any program to program the GP300 with!
I have the rib, but i need a program that i can use with my 2m radio. I have a program that works fine on the hi 70cm band, and I have a program that works on frekv over 146MHz.

I'm now locking fore a program that supports frev. below 146MHz.
Do you perhaps have any program that supports what I'm looking fore, ore maybe you know someone that might have it?

Many thanks, and I hope that you can help me!

/Kenneth

Has anyone experienced problems with the Kantronics KPC3-Plus in KISS mode? I encounter what seems to be buffer or variable overwrite that results in controlling program getting stuck in endless loop reading the serial port. I have not been able to get recognition of the problem from Kantronics.

Note: this is about KPC3-Plus, not the older KPC3, which is a different design.

Great to hear other guys using the old swans!
I put a pot in the screen voltage supply and I am able to run the rig
with it only puting out 5 watts or full power, the pot is a 5 meg ohm
if I recall and when set for low power you can never over heat your
finals and burn them out,even with no ant connected!
6hf5 tubes are hard to get, so are all most any tube that will work.
Good luck finding them!

ok try doing this, i dont know if it will work but im sure it will get you alot further than you are at the moment. Connect the output from the phone tap to the aux. line in of your amplifier on your stereo. then get the output from the stereo and put it into the mic in section on your computer. using the aux. port should manage to eliminate the "noise" from the recording. try it if it works get a switcher so u can still use ur cd or what ever is normally connected to ur aux. port.

It's an impedance matching problem. This isn't guess work; there are literally hundreds of texts on the internet (hint: search engine) detailing how to connect a telephone line to an audio source, and there are half a dozen basic schemes for doing so from down and dirty with a couple of resistors and capacitors to a wheatstone bridge with 600ohm balancing to a hybrid circuit that (duh) the telephone itself uses.... Electronics is fortunately one of the first things that got put on the web. <grin>

Hey There,

I am the proud owner of the Standard c181 handheld tranceiver!

Would please advice me?

How do I switch off the (ctsc???)-tone when I am using the
frequency-shift (offset and rpt?
What is the output power of this tranceiver?
What is the maximum operation voltage (6 or 12 or 13,8Volt)
Is there an adaptor availlable for 12Volt car voltage?
I would like to have a copy of an owners manual is that possible?

I HAVE A MOTOROLLA 2001 SERVICE MONITOR WITH A DEAD CRT.
It is a Magnavox model 95-p07964v001 or 96-80331a38
It was made by Magnavox electron tube division I assume now gone as i
could only find the industrial electronics division on the web.
I were told that there is also a Telefunken CRT that was used as well
and this may be more accessable.
Could any one point me in the right direction with any information.
thanks BERNIE

What I did for the "skirt", since I didn't care for the stock ft-50 ant., I took a xacto knife and carefully cut the bottom skirt off of it and slipped it onto the radios sma connector. Then attached whatever new antenna on it, this really looks good when using a Icom FAS 2/70, or VX-1r antenna.....

1255. Ultimeter 2000 logging

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-18 00:00:00 UTC
From: Alan Foley <axel@indigo.ie>
Message-ID: <3448B1FB.CF5@indigo.ie>
Source record: 163695

Attached is a copy of a message sent to Peet Bros., regarding the
Ultimeter 2000 weather station, anyone got any ideas?

Alan.
EI3EBB

Sir,
I`ve recently received an Ultimeter 2000 unit,unit works very well
but with one exception that I`ve been unable to solve.
I`d like to use the `Complete Record` mode for data logging as it
provides wind speed peak etc., and I may export log to Excel at a later
stage, overall this seems to be the most versatile mode.
`Logger` mode does not give any indication of peak wind speeds.
Problem as follows:
>> `Data Logger` mode works fine but is limited (no peak w/speed) etc.
>> `Packet Mode` appears to have info required but PC times out because
of 5 min delay and program crashes.
Which leaves `Complete record` mode.

> If `Winult` is run in any other mode other than `Complete` and then keypad is used to
change to `Complete Record` mode, all data is visible in monitor window. (ie all 448 hex
digits are sent to the PC, there is constant ouput from the unit), but of course the s/ware
at this stage does not recognise the output since it is expecting a different mode.
However,if `Complete Record` mode has been selected and `Winult` is
run the following happens.
The software recognises that `Complete` mode has been selected and
verifies same, but all 448 digits are not sent.
It appears that about 40-50 digits are sent, output appears similar
but not identical to that of `Data Logger` mode, I`ve verified this by
viewing output on a text editor.
So in a nutshell........
1. Complete record mode outputs all data when a different mode has
been set-up in `Winult`.
2. If `Complete record` mode is selected initially, the output
appears to be (chopped), unit does not output continuous data,outputs
every 3-4 seconds.
Note: header starts with &CR&, which I believe is correct.

Im sure there`s a simple answer to this but if so I can`t find it.
I`m running Win95 on a P75,32mb RAM, Winult and Ultimeter 2000.
If you have any information that may help I would appreciate it.
Many thanks for taking the time to read this message.

Good idea about putting the batteries in a child proof container..

>Questions:

>1. What car, marine, etc. heavy duty battery is best?
> Critical Specs
> or
> Specific Model

About any (good condition , of course) 12Volt battery would work
but when you say "best" then I would suggest two (2) 6-volt deep cycle
golf cart type batteries. There is typically only one size, so when
you find "golf cart type" battery, there is only one size, but can be
manufactured by many companies. Connect them together to acheive 12
-13.4 volts. I got mine from Sams Club for $35 each. I have also
used a little $16 , 12 volt garden tractor type battery to power my 50
watt 2 meter rig with success. If you can not find golf cart types,
then any "deep cycle" 12 volt battery would be my second choice.

>2. What battery charger should I use to prevent damage to the battery and
>to keep it
> properly and fully charged - without generating rf noise in the
>process (and to
> preferably have a reasonably accurate display of the battery
>condition).

I would suggest getting a low amperage input model, say 3-4 amps,
maybe 6. Again, Wal-mart, Target, Sears, ect handle these at
reasonable prices.... This charger would simulate a solar powered
setup and if left on 24 hours a day should provide plenty of power to
recharge those 2-6 volt (now 12 volt) batteries mentioned above. I
would strongly suggest you get a on-off timer to be placed between
electric wall outlet and the battery charger. I found an excellent

one at Grangers ($25) that can be set in half hour increments for the full 24 hour day. The timer controls the battery charger so you do not overcharge or boil the batteries. Of course, you will have to experiment a little to find out how much time the charger should be on to maintain your batteries. Last item is a volt meter to gauge the charge of the battery(s). An el cheap-o handheld type ($9.95) will do , and is much better than anyting that would come on a battery charger, or you can hard wire it in and have the face of the meter facing you for ease of monitoring. With this, you can regulate the timer-battery charger better. Suggestion, have the timer-battery charger come on when you are not in the shack so you do not have to worry about rf interference.. The batteries will have or should have enough storage capacity to operate without the charger being on... Depends then on what battteries you go with, right?

1263. Problem with HTX-202

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-18 00:00:00 UTC
From: jpoulin@honk.org
Message-ID: <877204943.16848@dejanews.com>
Source record: 163703

I just bought a HTX-202. They went on sale here in Ontario Canada.

I have a problem. I keep getting err2 on the display. Now in the manual, it indicates that this can be caused by RF getting back into the radio, and worse... the PLL mabee unlocking.

Has anyone else ever experienced thison a very frequent basis ?

Any recommendations on how to remedy this ?

Yes, the get excellent reviews. I just ordered the 30 meter
kit and the wattmeter.

There are pics and a review on the old model on K5FO's site.

For Sale: Yaesu FT-840 HF transceiver, FP-800 heavy-duty AC supply and speaker, FM-747 FM unit and SGC SG-230 automatic antenna tuner. Includes all manuals and factory accessories (Yaesu up/down hand mic, power cable) plus a plug-in AM filter bypass board (not Yaesu) that allows wide AM reception with the 1st IF filter. Also, 40ft tuner extension cable with remote "tuned" indicator and cables to mate with FT-840. All equipment in excellent condition with original Yaesu packing. $1150 plus shipping for the station. I'll entertain offers for the pieces on an individual basis.

There is a particular set of buttons you can hold during power on that
puts the unit into memory-only mode. See your manual. Perhaps this
can't be programmed via software, and that's why the item is grayed out.

Hello,

I recently bought a RCI-6030 Marine Radio, and I am wondering what kind of range does marine radio have on high power (25 watts)? I live near Philadelphia, PA, and there is just about nothing on the marine channels, and I am wondering if it is legal to use it like a mobile/base two way radio? I was reading something that said that the FCC has recently unlicensed the domestic use of marine radios, does that apply to this? Also, is there any possible way of doing a "mod" for the radio to put it on another band like 2 meters, or some other range? (Don't worry, I'm licensed, my call is N3ZVM) :-) Please e-mail me with your responses. I really apriciate it. Thanks.

73's,
N3ZVM

FT 1000 , nearly a D but no BP1 , no hi stab osc. xtal, . Very nice shape, performs flawlessly EXCEPT: the auto tuner has ceased to function. Will sell it as is for $1900 shipped in the southwest or split shipping if east or west coast(in other words, Ill pay 50 toward shipping , if more, you pick it up ok?) Im not a technician, yaessu says pull it out send it to em, get it back fixed for $75 plus or minus a few. You may not need the tuner, I didnt! Thanks Murray Neece Odessa, TX

All IC-2000H radios on the US market are labeled IC-2000 on the front panel (without "H") simply because proper IC-2000 is 10W south-east Asia model and it isn't sold in the USA. So, there can't be any confusion as to which one user purchased. Power output is the only difference, and you should not be able to find non-H versions here. Two versions are properly identified on boxes, and owner's manuals, however.

Well, sir,
I for one have not seen this piece of legislation, but, unless it directly affects Amateur Radio then good luck trying to get the Amateur Radio "community" to listen to you and help out the people that want to continue to be able to listen to other services. The amateur "community" has nothing else but it's own interests at heart, this includes if it reduces other people's ability to hear EMERGRENCY communications which may directly affect the life (lives) or property of those who would be (illegally) listening to police, fire, paramedics, cellular, etc. If these people would get off their duffs and let their congressman (woman) know how they felt there would be no threat at all to either the rights of hams or others to listen to whatever they want to, whenever they like. By the way, the way around the "scanner ban" is to buy your equipment from dealers in Canada!!!!!

Strange,

I use Agent (not the free version) and I _still_ get junk. I also
notice that Mr. Suddeth IS using free agent. You see, there is NO
universal answer to his question. Only opinions.

Message-ID: <19971019115300.HAA02219@ladder01.news.aol.com>
Source record: 163651

According to the spec sheet received from Comet, the SMA-503 is a Dual-Band 2M/70cm Antenna - - not a 3-Band Antenna.

I use the SMA-3 antenna. And to fill the gap around the connector I chose a black vinyl end-cap - - - used on the ends of tubing to protect the user from cuts and scrapes. Choose an end cap that is slightly smaller in diameter than the loading element (skirt) on the SMA-3. Then cut off the closed end of the cap using a sharp razor blade. Slide it onto the loading element (skirt) of the SMA-3 antenna, then screw it onto the FT-50R. It nicely fills the gap and seals the gap against dirt, water, etc. And it looks nearly like the original antenna.

Chris,
Depending on what bands you want to work and how far the
future upgrades will be will make a difference in choosing a rig. I've
been asked this question and it is hard to give a good answer. I usually
let new hams see my shack so they can see for themselves.
For the VHF / UHF novice I would recomend a 2 meter HT but
if they are out in a repeaterless area I recomend a higher power amp or
mobile. If they want to try HF and are planning to upgrade then I
recomend rigs like the Yaesu 840 or similair radios. Urban HAMs have
different requirements as there are usually many VHF and UHF repeaters
with many clubs to help out too. Drawback on this is somewhat resriction
on antennae for HF, space or covanents.
Then comes the miryad of used gear! A whole different story.
My interests were very wide and I wanted to try it all but HF is where I
really wanted to go. My club loaned my a two meter packet station and
that helped me decide that packet can be fun. I purchased used gear from
HAMfests and tried six meter and 440 FM.
Here's the list I would use if I started all over....

For VHF, The Radio Shack HTX202 (price and durablity)
For UHF, " " " HTX204 (cheap now till
gone)
For SIX meter, The MFJ portable rig (price and solar cycle
comming)
HF, Used TS430, Yaesu 840, Icoms, TS440 (one of these)
Build kits like the 38 special....

Yeasu FT-102 HF transceiver, FV-102DM digital VFO, and SP-102 speaker
for sale or trade. This station was purchased 1/30/84 at production close.
It
was checked, repackaged, and stored for 13 years. This is new old-stock,
final
production equipment.

SW55 for sale - radio in excellent condition. AM, FM and SW coverage. LSB
and
USB (plus AM of course) detection, wide/narrow selectivity, signal strength
display, low battery light, local/DX sensitivity switch, etc.... Unit stores
125 frequencies in 25 pages of 5 memories per page, with alphanumeric display.
Very convient for storing frequencies by station. Sleep times and five event
timer.

Radio comes with its own hard case, AC adapter wind-up antenna, manuals

$225 plus shipping in the CONUS. Leave e-mail to baxter@kuhub.cc.ukans.edu

Ross "codeman" N7VWX gave some practical advice in a separate posting. I'd like to offer a few variations on the theme.

The "best" battery may depend on how you operate. If you expect to be discharging the battery many times (versus keeping it continually charged to full/nearly full capacity), then you need a deep cycle battery. I use a Sears marine deep cycle battery (12 V) in my shack. I thought it provided the most amp-hours for the buck. If you rarely or never do deep discharges, any automotive battery will do fine. Be advised that the deep cycle batteries usually have a weaker sulfuric acid inside (specific gravity about 1.25 vs 1.28), so their resting voltage is somewhat lower than the auto battery's (12.7 vs 13.2 V). There's nothing wrong with this, but it does affect the charger settings you should use for a float charge.

I use a variable-voltage homemade linear power supply (4-A nominal) to keep the battery charged. It has no make or model number, but it also has no RFI. After a significant discharge (either type of battery), it should be charged for a while at 14 to 14.5 V with current limiting to 4 - 6 A. If you don't do deep discharges, you can maintain either battery on float charge (about 13.2 V for the deep cycle, 13.6 for the auto (I think??)).

I use a hydrometer to check the battery. Reading the voltage is fine for day-to-day monitoring, but you need to know the strength of the acid when the battery starts to go bad. I successsfully revived my last battery when the voltage readings said it was in steady decline, but the hydrometer said it just needed a high-voltage charge.

I can't remember the Web pages, but there are some good ones around on batteries and charging. I recommend that you try a quick search.

1329. End to background noise

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-20 00:00:00 UTC
From: morel.GRunberg@telrad.co.IL
Message-ID: <FA90C2154736D111AD5300805F927C420134DC@mismail.mis.elex.co.il>
Source record: 163512

Few months ago I heard that "Analog Devices" has a new
integrated circuit (SSM-2166) who is able to cancel the
background noise present in an audio signal coming from
a microphone.

After I received the 15-pages data specs & application note
I discovered that this tiny 14-pin IC can solve my background
problems coming from the amplifier blower, computer fan, TV
and radio sound, children cries and a busy street down under
my window shack.

After I've built the circuit and began the tests, I was astonished
by the effectiveness of the IC: simply all the background noise
was attenuated with an average of 35dB down of my voice. The
air reports were excellent and all my partners asked me what
I'm using to cancel the noises, after a short demonstration with
the unit bypass switch on/off. Now, I can use my processor at
compression levels much bigger than the previous 3-4 dB I used
before due to the high background noise with extremely low
distortions (typical 0.1-0.2%). Absolute no voice alterations or
any kind of time delays, echo or signal rise/fall timing related
problems
(as in other products) were found.

The unit is quite simple: an IC, 5-6 capacitors, 3-4 resistors and
5 small variable resistors. The supply is 5Vdc@15mA or 12-25V
if a simple 7805 regulator is used. The board can be as small as
3x4cm and should be placed in a small shielded box.

Some modifications should be made on the original schematic diagram
and setting procedure given in the "Analog Devices" application note.

The unit was tested with Yaesu/Kenwood/Icom transceivers and
performed very well with no RF feedbacks. The only difference is
of course, the microphone connector wiring.

Few of my local friends built also this small unit with very good
results
too. As I've heard, a complete kit and and an assembled kit will be
available very soon in U.S. Also, an article on this issue will appear
in "QST" very soon, as I've heard from some U.S. friends.

The unit is very useful for SSB contest teams when few operators
are crying in their microphones at same time creating a stressing
noisy environment.

The "Analog Devices" complete documentation can be found on their home page (www.analog.com) and can be read with Acrobat Reader software. If you don't have this program on your computer, you can download for free immediately via a link to "Adobat".

The 15-pages can be received also from Customer Support Hot Line automatic fax : 1-800-262-5643.

Source record: 163515

Hello John,

I can't believe the typos in that last posting. My secretary needs her butt kicked.
Here it is again:

That little weensy plug on the end of the Heil Pro Set cable is for the microphone circuit.

That big 1/4" plug on the end of the cable is your earphones plug, which goes right into the headphone jack on your radio.

There is an adapter cable sold specifically to mate that weensy little microphone plug to one of those wierd connectors used for Kenwood rig microphone jacks, and yet another one is made for Icom rigs. I have one of each. It's a simple matter to make one yourself. The adapter cables that I purchased, "ready made", have a 1/4" jack for plugging in a Push to Talk Switch, but I don't use that, because I use a foot pedal wired into the PTT line in the accessory plug on the back of the Kenwood rig.

From: jason_hsu@nospam.bigfoot.com
Message-ID: <62g1nu$ai@drn.zippo.com>
Source record: 163517

Does the memory effect on NiCd batteries really exist?
On the one hand, the ARRL says that the memory effect is a myth. In fact, the author of an article in the "New Ham Companion" says that memory is such a rare problem that manufacturers have difficulty causing it so they can study problem and that the satellite industry doesn't consider memory to be a great risk.
On the other hand, I know an experienced ham who says that the ARRL denies the existence of memory due to the influence of advertisers, who have a vested interest in the need to replace batteries.
Can anyone resolve this conflict for me?

1335. Re: Memory: fact or fiction?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-20 00:00:00 UTC
From: John Buck <jrbuck@interpac.net>
Message-ID: <344BA58B.21ACF82E@interpac.net>
Source record: 163518

The Ni-Cad memory effect is one of most believed myths in ham radio.
Modern cells do not have this effect. Some apparent memory effect in
multicell batterys may be due to tempory shorts of one or more cells due
to cycling and charging abuse.

Myths usually have some sort of historical basis.
Early Nicads in the 1960/70 time frame had some detectable degradation
if left on trickle charge for long periods of time. Even then the effect was
a slight reduction (millivolts) in the apparent cell voltage and not a
reduction in amp hour capacity or damage to the cell. The effect
was reversible by one or two full discharge charge cycles. Even this
small effect is not visible in modern batteries.

Contrary to the silly opinion that someone is covering up the effect to
make some advertisers look good, it is more likely that some retailers promote
the myth in order to sell alternate chemistry, more expensive batteries, or just
to encourage gullible users to full cycle their batteries so they have to be
replaced more often.

If a Nicad is good for 300 full cycles, it may be good for 1000 to 3000
typical partial cycles. DO NOT FULL CYCLE YOUR NICADS unless you really
want to replace them much more often than necessary.

By the way, Nicads do degrade with time. My observation is that 3 years is a good
replacement time if
high reliability and maximum capacity is desired.
Full cycling at every use may reduce this time to about one year.
Many people have obtained better results than this. There are many variables,
including: Storage temperature, overcharge history, initial battery cell to cell
capacity matching, number of full cycles plus equivalent partial cycles.

An additional disadvantage of full cycling is that when used in multiple cell stacks
to make batteries, that a full cycle is likely to cause the weakest cell in the
stack to become reversed. That is the cell with the least capacity discharges
first and gets reverse biased by the cell that are still providing current.
This effect is very hard on cells. It promotes the growth of micro short circuits
which can result in premature failure of the cell.
By the way, I have found that clearing of shorted cells with high current usually
results in a cell that works for a while but is not long term reliable.
Some of the newer cells that pack more capacity into the same weight and size
do so at the expense of a more fragile dielectric separator. Some of these
are even more susceptible to charging and cycling abuse.

I have used and abused these things since the early 70s.
I hope these observations help.

Source record: 163519

For those who purchased the MAHA MH-A104 2 meter amp,
DO NOT adjust the TX ouput when keyed up! You will blow the input transistor. Maha recommends that you leave the TX slide control all the way on high and leave it there. This is from first hand experience. I had to return mine to HRO in NH (Manuel is excellent!) for a new one. Maha says they WILL include a note in future manuals about the problem. Also, do NOT adjust the output less than 30-40W either or damage may also occur.

Just wanted to warn others who may be thinking of getting the unit. It IS an excellent amp, I really like it but bought it because it was supposed to have adjustable output. Maha was excellent at helping me with the problem. I do recommend the amp just don't adjust the ouput!

Vice versa, Err2 is the PLL error.

The usual cause of PLL unlocks is _because_ the RF is getting in
unless it's just defective.

> by the looks of this I'd suggest
> you return it for a working unit, or warranty repair. DavidC

There is one case where this is not a warranty situation, see below.

Decision procedure:
* If you get err2 in Receive mode with fully charged batteries (not on
an adapter or anything)
* or when transmitting with factory antenna
and factory battery (not with external power or add-on antenna),
--> don't trifle with getting it serviced, it's a dud, ask to exchange it
for a working one. (Assuming you're licensed, test the new one at
the counter before walking away.)

* If Err2 only occurs in the "normal" situation described below
* And you can live with "when it hurts when you do that don't do that"
--> Then you're ok, just don't do that
* else if you can't live with that
--> Then hope you can still return it for refund and buy a higher-
priced true 12V/5W HT.

THE USUAL CAUSE OF ERR2 IN HTX-202: TRYING TO DO 5W INTO THE DUCKY

This will happen if you use the top-mounted 12V connector to get 5W out
with the factory rubber duck. The basic problem here is there's no
choke on the 12V power on top and it's really close to the base of the
rubber duck. It couples back in very efficiently. PLLs react badly
when their "DC" power has VHF ripples. :-(

You have to use a remote antenna (magmount or baseball-cap-mounted
ducky or twin-lead J out the window or something) to keep the RF from
coupling from the BNC to the 12V connector an inch away.

I had good luck with a pair of BNC-right-angle connectors and a
base-loaded whip so the antenna extended out and _down_ toward the
pavement while the power and a *coiled* radar-cable running up and in
to the gell-cell in my backpack, but your mileage may vary. (If you do
this, be prepared to lose antennae if you don't check the tightness

regularly!)

---

hints from experience for new HTX-202 owners:

Don't run 5W without the belt-clip; it's the heat sink. (Don't even act as net control at 2W w/o the belt clip, it gets warm...)

Radio Shack will sell you, shipped by mail but ordered in any store, the service manual for just about anything they sell. If you didn't buy the "TSP" extended maintenance/warranty package, get the service manual. If you expect to own it longer than the TSP runs, get it anyway, you'll get a real book now but when they've discontinued the item they'll charge you for a photocopy of the shop book (which has the advantage you've got their years of notes but...)

Note that if you want to improve your range, it's always better to add Antenna first, then power ... so try 2W (regular battery) with a better antenna than the supplied rubber dummy load (which is the same unit they give away with scanners covering 30-800 MHz and their 440, GMRS, and business radios!) with a tuned 2m band antenna with some metal in it and some size to it. 2W into a true 1/4-wave (you know, 19") or a monster roof mount gain contraption (eg., NMO 5/8-wave screwed into the roof of my van, nice big metal ground plane) would beat 5W into a ducky even if the radio would work with 5W of RF feeding back into it's power connector.

(For those who weren't aware, the HTX-202 is 5W capable only on external power; connecting a 12/13.8V pack to it's bottom port is likely to cook something, and using the charge port on the batter pack only boost power up to the pack's built in charge voltage, not to the voltage you think you're sticking in, which is a Good Thing since the rest of the radio wouldn't like 13.8V applied to it's docking plate. There are other radios that will do 5W with a 12V pack extra-price accessory, but putting an Icom 12V pack on this baby isn't good for your longevity of ownership.)

Hi Gang!

The KB8TNQ Ultimate Amateur Radio Page has a new location! If you have trouble accessing the main link, you can find us at: http://www.qsl.net/kb8tnq and we hope you enjoy it.

We would also encourage you to send in your suggestions for the Links Page. This is the newest addition to the Site and we need your input, so send em' in.

7-3,
Erv KB8TNQ

1350. AF vs. IF - DSP - Why?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-20 00:00:00 UTC
From: Pete McGreevy <PMCGREEV@MAIL.IDT.NET>
Message-ID: <344C116F.3395@MAIL.IDT.NET>
Source record: 163533

Question...

What are the actual benefits of having the DSP of a tranceiver in the IF stages, as opposed to the AF stages? In what types of situations would an IF DSP system really shine, while AF might not? And finally, oculd you actually tell a difference between the two systems if you were blindfolded... and what would that difference be?

Any and all answers appreciated, for information, and a general conversational topic.

Thanx -- Pete -- KA2YDY

I'm very pleased with mine- the out of band reception is very good as well.
Make sure you can see the screen where you're going to install it...it can
be kind of hard to read if the sun shines on it.
Good luck.

Very good reply, Clark. Surprised how many folks don't get this important (AGC) difference.

I use audio DSP and I'm happy with it. But the xtal filter in RF stage is a must.

Waiting for DSP in true RF (455 or higher) IF stage for my next rig upgrade.

Phil

jason_hsu@nospam.bigfoot.com wrote:
: Does the memory effect on NiCd batteries really exist?
: On the one hand, the ARRL says that the memory effect is a myth. In
: fact, the author of an article in the "New Ham Companion" says that
: memory is such a rare problem that manufacturers have difficulty
: causing it so they can study problem and that the satellite industry
: doesn't consider memory to be a great risk. On the other hand, I know
: an experienced ham who says that the ARRL denies the existence of
: memory due to the influence of advertisers, who have a vested interest
: in the need to replace batteries.
: Can anyone resolve this conflict for me?

I know I'll be one of many responders, but I just feel like typing something... From what I've gathered over the past few years, the simplest thing to say is that memory is "mostly" a myth. It essentially is a misinterpretation of what happens when you charge a nicad too long, or charge it improperly. Long term overcharging can reduce the overall capacity of a battery by using up the electrolyte (really the water in it) and causing heat which deteriorates the cell.

But before permanent damage happens, overcharging can cause "voltage depression", where the battery discharges at a lower voltage than expected. The amp-hour capacity of the battery is not affected (of course, the watt-hour capacity would be somewhat affected). This type of voltage depression can be reversed by properly recharging the battery.

Ken Nakamura wrote a detailed article a while back on nicad chemistry. He stated that voltage depression can also be caused by very low-rate charging (causing large crystal cadmium to form, increasing internal resistance), heat, and long term partial discharge cycling of a battery (causing the consistently undischarged portion of the battery to coalesce into large crystal cadmium). This would be the closest thing to the classic "memory effect". In this case, an occasional 90% capacity discharge of the battery (NEVER discharge a *battery* to zero volts, this will ruin one or more cells in short order) should clear the voltage depression.

Bottom line, the classic memory effect, where a battery suddenly gives it up after only, say, 50% of its capacity is used, is 99.9% a myth. Overcharging was probably very common with the old "timer" type chargers. Newer Delta-V chargers should not be causing these problems.

BAD things for nicads:

* Heat (eg, a hot car).

* Running a battery down below about 1 volt per cell. At 1 volt per cell, almost all the juice is gone. Running a battery much below this risks cell reversal, which is pretty much "kiss it goodbye".

* Discharging before charging. Unfortunately, this technique has been propagated by all those "battery conditioners" out there which purport to avoid memory. At most, a very occasional complete discharge might be advisable. Discharging a half used battery before charging it simply makes the battery wear out sooner. It might have been advisable in the days of fast timer-type chargers, but should not be needed today.

* Long term overcharging, as above.

I find the conspiracy theory between the ARRL and manufacturers pretty funny. You'd think they'd want the ARRL to push the memory effect so they'd sell more NiMH batteries.

In fact I do believe that many manufacturers of battery operated equipment DO "conveniently" push the memory effect when advertising Li-ion and NiMH batteries. Why not -- it'll help to sell the batteries.

It turns out that nicads are far from obsolete. They still excel at high discharge currents and overall life, if treated properly.

>blindfolded... and what would that difference be?

Hi Pete:

The main difference, and the one I can really hear (as can anyone)
is that most AF DSP is outside of the AGC loop in the receiver.
That means that if there are two strong signals in the IF passband,
the AGC will "pump" up with the strongest signal in the, say,
2.4 kHz passband, while the one you want to hear, if it is weaker,
will be picked out very well by your AF DSP but will be seriously
desensed (lower signal level as the AGC pumps with the other signal's
strength). This is easily heard on the new Yaesu FT 920, as I
just showed it to a friend. Without the CW IF filter in it, tune
in a pair of strong CW signals, try to pick out the weak one with
the AF DSP. Watch the S meter stay up with the other signal that
you no longer hear through the DSP. If the difference in signals
is great, it may be difficult to copy the weaker signal that you
wanted.

Now, if the DSP is in the IF and inside the AGC loop (you CAN do
this inside an AF AGC loop in many older Ten Tec's with an AF
DSP, by the way!) then you won't have the pumping problem anymore.
But IF DSP has its own set of other problems, not all of them
solved (yet?!)

Also, a good narrow IF CW filter will help you zero in within
the AGC loop and will help the AF DSP do its job properly.

Hope this helps.

Clark

Hey Peter,

That's what I was trying to say, but, as usual, I got it a little
horsed up. I once worked at an FM station that ran about 10 KW input
plate power and we had a so-called 73 KW ERP. I remember that we had
an 8 bay square loop antenna with a gain of about 10 db, but that was
almost 50 years ago, and my brain has gone soft since then.

Hello John,

That little weensy plug on the end of the Hei Pro Set cable is the microphone circuit.

That big plug on the end of the cable is your earphones plug, which ges right into the headphone jack on your radio.

There is an adapter cable sold specifically to mate that weensy littly microphone plug with one of those wierd connectors used for Kenwood rig microphone jacks, and yet another one is made for Icom rigs. I have one of each. It's a simple matter to make one yourself. The adapter cables that I purchased ready made have a 1/4 jack for pluggin in a Push to Talk Switch, but I don't use that, because I use a foot pedal wired into the PTT line in the accessory plug on the back of the Kenwood rig.

Oh. Well it would be nice if they did come out with a 2 meter
handheld SSB capable then.

1378. FT290R Mk1 Mic Gain Boost?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-20 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <344b18b5.0@newshost.pcug.org.au>
Source record: 163605
Cross-posted to: aus.radio.amateur.misc;,rec.radio.amateur.equipment

I have a Yaesu FT290R (Mk 1) that has recently had its microphone insert replaced. However, the insert delivers less output than the one that it replaced. Therefore the audio level is down, though the peak deviation is OK.

Does anyone know of a mod or internal control that can boost the gain of the speech amplifier?

I picked up a couple of Heathkit HD-4040 TNC's this weekend at the local ham fest. They seem to work OK, but do not have the original ROMS installed. Would anyone have a set laying around the shack they would like to get rid of? I would also be interested in a dump from the roms, as I could burn my own if need be.

Thanks
Dale

I agree. Maybe an updated version of the IC202 rig. About the same size,
but with 10m/6m/2m/70cm SSB and FM. Certainly a combined 10m/6m SSB
handheld would be good for the approaching sunspot cycle.

Source record: 163468

Yeah, see, that's my thing as well, I want to replace my FT-900 with something bigger, and dont want to blow over 2000, and still want IF DSP, so the 920 is out, maybe the 756 or new 746, I dont know, maybe I am just better off waiting a year or 2 until this "new technology" further saturates the market and is found on more radios. Right now I am told that even the 756's DSP system is not "true" IF DSP, so what's a ham to do :)

> Can anyone resolve this conflict for me?

Memory is exceedingly rare with NiCads. It requires very special conditions
to occur. The battery must be very precisely charged to a certain level and
very precisely discharged to a certain level *every* time for dozens of cycles
for the memory effect to occur. If you vary the charge or discharge even once,
memory will not occur. This effect was first seen in a satellite application
where the charge/discharge was completely controlled by orbital dynamics and
thus was exactly repeated again and again. See the Gates Battery Handbook for
a discussion of the effect. Available capacity *is* reduced by the memory
effect, but several full charge/discharge cycles will restore it to normal.

An effect which is *much* more common is called "voltage depression".
The cause of this is *overcharging*. Battery capacity is *not* reduced by
voltage depression, but it can fool the auto-shutdown circuits of some battery
powered equipment into thinking the battery is discharged. The cure for this
effect is to simply cycle the battery *one time* past this point and then charge
it *correctly* in the future.

Amateurs can avoid both of these effects by not *overcharging* their batteries,
and by not discharging them to exactly the same point each time before
recharging. Partial cycling NiCads actually extends their life over doing a full
discharge and recharge each time. A NiCad has the ability to provide between
500 and 1000 full discharge/recharge cycles before the irreversable minor
chemical pathways make the battery unusable. But it can tolerate several
thousand partial cycles before the minor chemical pathways run to completion
and the battery must be replaced.

1397. Kachina -A1 service

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-21 00:00:00 UTC
From: sca00135@mail.wvnet.EDU
Message-ID: <199710211248.FAA29891@mailbox2.ucsd.edu>
Source record: 163471

I feel compelled to pass along the following story concerning my new Kachina 505DSP. Too often we fail to pass along praise when deserved.

Anyway, I bought the new 505DSP about two weeks ago and received it via UPS ground. After unpacking and installing I did not have any receive audio or transmit RF output. After spending several hours determining the problem was not with my setup, I called the telephone number listed in the Kachina manual and guess what?? A human being actually answered the telephone !! Will wonders ever cease. I explained my need and was quickly connected to Al Hugueny (sp?) N6YY who is the marketing manager for Kachina. Al listened to my problem and decided I needed to talk with Doug Smith, KF6DX, who is the head design engineer for the radio. Doug had to be paged from an antenna project but was on the phone with me in 10 minutes.

After several tests were performed by me at the direction of Doug, he had me open the case and take a look. He suggested a board may be dislodged from it's socket and I found 3 of the boards actually were out of their sockets. Re-inserting the boards restored the receive audio but did not help the lack of transmit output. I noticed that two of the four heat-sink screws were sheared and upon closer inspection of the final RF amplifier section found a broken torroid. Undoubtedly the radio had been "hammered" very hard somewhere along the shipping line.

When it became obvious I could not fix the problem, Al told me he would ship me a new radio out that day via FED-EX overnight with Saturday delivery. I explained I was going out of town for 3 days and regular ground shipping would be fine but he insisted it be shipped overnight to insure my new radio would be waiting on me when I returned home. As promised, the new rig was delivered Saturday. It works GREAT , as advertised. I received a follow up telephone call from Al making sure I received the radio and all was working fine.

I now have the Kachina in the operating position and testing it's performance. Using my 1000MP as comparison.

Summary-- For anyone who has dealt with Yaesu or Kenwood service departments (don't know about Icom) I know this is hard to believe.

1. My phone call was answered on the first call.
2. I was immediately connected to someone who was knowledgeable, helpful, and spoke understandable English.
3. I was never put on hold or had to navigate voice mail.
4. A promised return call was made within 10 minutes.
5. I was not told to deal with the dealership that sold me the radio.
6. My problem was resolved, not by sending off my radio and waiting 6

weeks for it to be fixed, but by replacing the radio with a new one.

For all the skeptics, I have no association whatsoever (except as a customer) with the Kachina company. I just feel that exceptional treatment should be applauded.

73, Sam--K8WVA--

I need a copy of the service manual
for the Yaesu FT2700RH dual bander.
That's service NOT owner's manual.

Will to pay reasonable copying costs.

Please reply to dwoof@lucent.com as
my mailer is inserting the wrong "From"
address.

It' Steve, W1GSL, coordinator of the MIT Flea, who maintains
and distributes the list. He includes anything within an
un-reasonable drive, for the die-hard collectors/sellers, and
anything of particular interest to him. It also goes out on
the reflectors (barc-list, ne-ham, scan-mass-east & scan-tech;
I'm not sure if it's also on EMA-list or NEDIV-list or not,
it probably ought-to-be) and packet and is archived on WWW; I'll cut
and paste from the Oct.03 edition:

"This list has been posted... as a service of the individual home
page owners, to the following WWW sites.

http://www.berkshire.net/~robbins/flea.html
http://www.connix.com/~wz1v/ne-fleas.html
http://www.mmra.org/~mmra/flealist.htm

Gary;
Thank you for the fax. It worked great. I'm still currious as to what this radio can do. There are options such as power save, Hi/Lo power software settings ect..
BTW is this radio still in production?

Once again, thank you for the help. It seems that you may have recruited a new customer (I'm a yeasu fan).

: Thanx -- Pete -- KA2YDY
The key reason for DSP is selectivity. One wants to have this in
the IF on most receivers because that is where the Automatic Gain
Control is applied. If AGC is derived from the Audio after the
filter, that would be ok as well.

One general principal that either version does not follow is
try to get the selectivity as far forward in the amplification chain
as possible so that chances of overload and non-linearity are reduced.

As far as the transmitter is concerned, I might prefer to have the
DSP at IF because I could then use it for phase based rather than
filter based sideband generation. Note that I could also use it for
various kinds of detection.

Subject: AF vs. IF - DSP - Why?

Yeah, see, that's my thing as well, I want to replace my FT-900 with
something bigger, and dont want to blow over 2000, and still want IF DSP,
so the 920 is out, maybe the 756 or new 746, I dont know, maybe I am just
better off waiting a year or 2 until this "new technology" further
saturates the market and is found on more radios. Right now I am told
that even the 756's DSP system is not "true" IF DSP, so what's a ham to
do :)

From: sca00135@mail.wvnet.EDU (Sam Hall)
Subject: Kachina -A1 service

I feel compelled to pass along the following story concerning my new
Kachina 505DSP. Too often we fail to pass along praise when deserved.

Anyway, I bought the new 505DSP about two weeks ago and received it via UPS ground. After unpacking and installing I did not have any receive audio or transmit RF output. After spending several hours determining the problem was not with my setup, I called the telephone number listed in the Kachina manual and guess what?? A human being actually answered the telephone !! Will wonders ever cease. I explained my need and was quickly connected to Al Hugueny (sp?) N6YY who is the marketing manager for Kachina. Al listened to my problem and decided I needed to talk with Doug Smith, KF6DX, who is the head design engineer for the radio. Doug had to be paged from an antenna project but was on the phone with me in 10 minutes.

After several tests were performed by me at the direction of Doug, he had me open the case and take a look. He suggested a board may be dislodged from it's socket and I found 3 of the boards actually were out of their sockets. Re-inserting the boards restored the receive audio but did not help the lack of transmit output. I noticed that two of the four heat-sink screws were sheared and upon closer inspection of the final RF amplifier section found a broken torroid. Undoubtedly the radio had been "hammered" very hard somewhere along the shipping line.

When it became obvious I could not fix the problem, Al told me he would ship me a new radio out that day via FED-EX overnight with Saturday delivery. I explained I was going out of town for 3 days and regular ground shipping would be fine but he insisted it be shipped overnight to insure my new radio would be waiting on me when I returned home. As promised, the new rig was delivered Saturday. It works GREAT , as advertised. I received a follow up telephone call from Al making sure I received the radio and all was working fine.

I now have the Kachina in the operating position and testing it's performance. Using my 1000MP as comparison.

Summary-- For anyone who has dealt with Yaesu or Kenwood service departments (don't know about Icom) I know this is hard to believe.

1. My phone call was answered on the first call.
2. I was immediately connected to someone who was knowledgeable, helpful, and spoke understandable English.
3. I was never put on hold or had to navigate voice mail.
4. A promised return call was made within 10 minutes.
5. I was not told to deal with the dealership that sold me the radio.
6. My problem was resolved, not by sending off my radio and waiting 6 weeks for it to be fixed, but by replacing the radio with a new one.

For all the skeptics, I have no association whatsoever (except as a customer) with the Kachina company. I just feel that exceptional treatment should be applauded.

Tried ARRL, for some reason it's not there - and looks as though they have
left stuff from last year on the list - who knows why?

Anyhow, I will keep an eye on rec.radio.swap for some word. I guess I
could make a couple of calls to local hams as well - it's tough without a 2
meter rig! :-) Got one coming though! Thanks again! DavidC AA1FA

> Can anyone resolve this conflict for me?

Memory is exceedingly rare with NiCads. It requires very special conditions
to occur. The battery must be very precisely charged to a certain level and
very precisely discharged to a certain level *every* time for dozens of cycles
for the memory effect to occur. If you vary the charge or discharge even once,
memory will not occur. This effect was first seen in a satellite application
where the charge/discharge was completely controlled by orbital dynamics and
thus was exactly repeated again and again. See the Gates Battery Handbook for
a discussion of the effect. Available capacity *is* reduced by the memory
effect, but several full charge/discharge cycles will restore it to normal.

An effect which is *much* more common is called "voltage depression".
The cause of this is *overcharging*. Battery capacity is *not* reduced by
voltage depression, but it can fool the auto-shutdown circuits of some battery
powered equipment into thinking the battery is discharged. The cure for this
effect is to simply cycle the battery *one time* past this point and then charge
it *correctly* in the future.

Amateurs can avoid both of these effects by not *overcharging* their batteries,
and by not discharging them to exactly the same point each time before

recharging. Partial cycling NiCads actually extends their life over doing a full discharge and recharge each time. A NiCad has the ability to provide between 500 and 1000 full discharge/recharge cycles before the irreversable minor chemical pathways make the battery unusable. But it can tolerate several thousand partial cycles before the minor chemical pathways run to completion and the battery must be replaced.

Subject: ***MARINE RADIO MODS/INFO?***

Hello,

I recently bought a RCI-6030 Marine Radio, and I am wondering what kind of
range does marine radio have on high power (25 watts)? I live near
Philadelphia, PA, and there is just about nothing on the marine channels, and
I am wondering if it is legal to use it like a mobile/base two way radio? I
was reading something that said that the FCC has recently unlicensed the
domestic use of marine radios, does that apply to this? Also, is there any
possible way of doing a "mod" for the radio to put it on another band like 2

meters, or some other range? (Don't worry, I'm licensed, my call is N3ZVM)
:-) Please e-mail me with your responses. I really apriciate it. Thanks.

73's,
N3ZVM

Same range as a 25 watt 2 meter radio.

I live near
> Philadelphia, PA, and there is just about nothing on the marine channels,
and
> I am wondering if it is legal to use it like a mobile/base two way radio?

No.

I

Not unless you will be using it on a non-commercial vessel in US waters.

Also, is there any
> possible way of doing a "mod" for the radio to put it on another band like 2
> meters, or some other range?

Probably not.

(Don't worry, I'm licensed, my call is N3ZVM)

Subject: AF vs. IF - DSP - Why?

Very good reply, Clark. Surprised how many folks don't get this
important (AGC) difference.

I use audio DSP and I'm happy with it. But the xtal filter in RF stage
is a must.

Waiting for DSP in true RF (455 or higher) IF stage for my next rig
upgrade.

Phil

Nick <sputnick@intnet.net> writes:
>where can i find info on the ft 51? i want to compare it to the ft50.
>btw, thanks to all who replied to me about the ft50 info

I have one of each, and I find that the "mental models" of how the
various features of the two radios work have much in common. The major
difference is that the FT-51 is a true dual radio, while the FT-50 is
a single radio that covers 3 bands.

More detail: The FT-51 has completely separate UHF and VHF transceivers,
and both can be active simultaneously. You can receive on both at once,
or receive on one and transmit on the other. The latter feature allows
full-duplex conversations with someone who has another similar transceiver.
It also allows the FT-51 to become a cross-band repeater, either one-way
or two-way.

There are some additional fudges that add flexibility to the FT-51. There
are cross-connects between the VHF/UHF front ends and the "other" mixer/IF,
so you can receive UHF on the VHF receiver and VHF on the UHF receiver
(thus allowing dual VHF or dual UHF receive). But there are some frequency
restrictions, and only the VHF side has an AM detector (for aircraft).

The FT-51 is also operated as if it was two radios. There are separate
memory banks for the left and right sides of the radio, and separate "VFO"
memories (2 for each band). Each radio will receive somewhat outside of

the VHF or UHF ham bands.

The FT-50, on the other hand, has only one full transceiver. There is
only one set of audio circuitry, but two PLLs and two RF power amplifiers
(VHF and UHF), and three front ends (VHF, UHF, 800 MHz). You can receive
only one frequency at a time, and can't simultaneously receive and transmit.
But reception covers a much wider frequency range than the FT-51. It has
a wide FM IF filter that apparently isn't wide enough for 75 kHz deviation
FM broadcast radio, but is OK for 25 kHz deviation TV sound.
There is only one pair of apparent "VFO" memories, and a single set of
channel memories.

There are also operating differences. The FT-51 has many more buttons on
the front and side of the radio, and most commonly-used functions can be
accessed relatively directly by a button push or two. Lesser-used functions
are relegated to a "set" mode that uses the knob to select between them.
The FT-50 allows you to get at almost all settings via the knob, and forces
you to use the knob for many more of them since the direct keypad equivalents
are not present on the FT-50.

Finally, there are some other feature differences. The FT-50 has DCS
squelch, the FT-51 doesn't. The 51 can send alphanumeric messages to
another FT-51 and they are stored in memory on the receiving end; I don't
think the 50 can do this. The 51 can display frequency and alphanumeric
channel info simultaneously; with the 50 you have to choose. The 51 has
a "spectrum scope" that shows activity on a range of channels; the 50 has
nothing like it. The 50 is "waterproof" (really splashproof); the 51
does not claim to be. The 51 has standard BNC antenna connector and
a standard speaker/mike jack pair. The 50 uses SMA antennas and a strange
4-pin speaker/mike jack.

Hmm, what else do you want to know?

Dave

I agree. Maybe an updated version of the IC202 rig. About the same size,
but with 10m/6m/2m/70cm SSB and FM. Certainly a combined 10m/6m SSB
handheld would be good for the approaching sunspot cycle.

> 3 or something

Actually, it sounds like he's grounding one leg of the phone line through
the headphone jack, or he's got a ground loop. It wasn't designed to be
connected to an input of some kind, just ungrounded headphones. The input
jack on the sound card is grounded to the case, and in turn the house
wiring ground.

He needs an audio / phone isolation transformer. A phone 600 ohm to 600 ohm
should do the trick. Wire the headphone out to one side of the xformer, and
the two output leads to the input ('LINE' if its got it) jack for the
soundcard.

Be careful connecting external stuff to your PC, I've seen wiring faults
with 120vac on a supposedly grounded case! Saw a printer go up in smoke...
and been knocked flat on my ass by the same thing.

I just acquired a Kenwood TS-520 (white face). However, none of the accessory plugs came with it. I remember from long ago, when I owned a TS-820S, that some of these plugs had jumpers in them that were needed to make the radio work. If anyone has the pinouts for these jumpers, please, let me know. So far, the previous owner has not been able to find the plugs or the operator's manual.

Thanks,

Mike Goad

Doesn't the delay problem go away as the speed of the DSP chips
increases? If this is so then as prices come down for higher speed chips
I would expect the DSP to take place at higher and higher IF
frequencies. It is also my understanding that ICOM, although they use IF
DSP (at a very low IF frequency) still has the DSP outside the AGC loop.

I wonder what benifit that provides over audio DSP (other than marketing).

I've had one for about a month now. I Love it so far...especially
the blue on blue screen. Although the screen is difficult to read
with "polarized" sun glasses and/or bright sunlight shinning in
the vehicle, at night time you can dim it down to your liking
(although it makes for a nice "night light" within the vehicle! LOL).
I purchased the DFK-3C display cable kit. I should have taken the
sales reps advise and purchased the DFK-7C kit as it turned out to be
not so an easy install under the passenger seat of a 1997 Jeep Cherokee.
The DFK-7 would have allowed me to mount the radio body in the
cargo compartment of the Jeep in a cubby hole, and alowed me to
mount it anywhere if I descided to remove it from the Jeep and mount
it somewhere else in another vehicle.
Unless you're mounting the body of the radio in close proximity,
you may want to purchase the MJ-89 Modular mic switch. This will
allow you the extend the length of the mic cord, as it plugs into the
body of the radio, and not the control head.
A remote speaker or a pair(if you don't want to run the two receiver
signals together) will be needed if you plan on mounting the body of
the radio under a seat, in the trunk, or rear cargo area of a vehicle.
GL,
Eric(N2JHJ)

1420. 706MKII or TS50?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-21 00:00:00 UTC
From: Allan <amerzer@stlnet.com>
Message-ID: <62ir50$h0i$1@news.stlnet.com>
Source record: 163494

I am considering a relatively inexpensive HF rig. I like the ICOM 706MKII and the Kenwood TS-50S. They appear to be able to be used as base stations and mobile rigs, with additional equipment, such as antenna tuners, power supplies etc...
If anyone has experiences with either of these rigs, I would appreciate your comments, good or bad. I just upgraded to Tech Plus and will be General next month and probably Advanced by the end of the year.
I want to do primarily SSB on the HF bands, 160m-10m.
I know the 706 also has 6m and 2m, but it also costs about $500 more than the Kenwood. I already have a 50 watt mobile 2m and dual band HT.
I guess I mainly want to know about the technical qualities of these rigs. Full featured HF rigs that cost a few thousand dollars have so many more controls on them. Do these smaller rigs have good reception also and do they transmit just as good?
I'm not interested in big time contesting, just good, quality QSO's in the U.S. and DX.
Thanks for your help.
Allan

>I thought it was 4 watts and 4 miles. <g>

usually... depends on the type of the antenna that you have... beam
or rubber duck...

geneally speaking, 1 watt = 1 mile is pracical.

if sun activity is high, you may be able to talk someone over Europe
because of propagation... if you prefer to talk someone over the
long distance, you may want to get one with SSB because European
stations are using FM + SSB, north american stations are using AM +
SSB.

I have a Magellan GPS 4000 listed on ebay right now.

Ebay lets you make a bid on lots of cool ham radio and other items.

Higest bidder wins, but I'll bet this one goes for under $200.00

Wouldn't you like a GPS for that laptop?

To see the unit, get more details or e-mail me, go to the site below:
http://komodo.ebay2.com/aw-cgi/eBayISAPI.dll?ViewItem&item=1240311

Good luck,
David

I've got a 706 Mk II in my Jeep, with an SGC-231 tuner (covers 1-60 MHz).
I also have an old Icom IC-901 for 2/440/etc.

I love the remote head- the radio guts are in the back and the control head
is up with me. Performance is ok- the antenna system you use working mobile
is going to be far more limiting than the radio itself. I've got a 20 meter
hamstick ($20) on either a trailer hitch mount or up on top using a four
magnet mount.

This morning, sitting in a parking lot in Palo Alto (CA- west coast) around 0800
pacific time, I could hear XU6WV (WB?) in Vietnam on 14.182. He couldn't
hear me, sigh- but he was drawing a crowd. I did work NX2R in Cheyanne,
Wyoming though. Thanks for the contact, Sal!

Mobile HF is a lot of fun. Be careful. I hate twits that use cell phones
while driving; I try not to imitate them on the HF bands.

73-

You only need one. Jumper pin 8 to pin 9 on the VFO jack and it should
work (I have used a short piece of solder)

==========
I have both a TS50S and a 706 (the original 706, not the MkII). I have
used both extensively as portables (battery while on canoe trips) and
mobile. I now use the TS50S exclusively as a base. The 706 is easier to
use mobile or portable. The remote head is great for mobiles - I have
mounted it on the top of a flexible stalk which I bolted to the side of
the seat. THere is not much difference between the rigs re power levels,
power draw and quality of received audio. For my money, I would prefer
two 706;s rather than a TS50s & a 706. For mobile use, the layout of
the 706 controls is better. And th 706m has two meters, so you only
really need one rig to cover all bands etc.

Good luck.

Hello Pete,

DSP's operate in the frequency domain. If the interfering signal is
sufficiently separated from the desired signal (in frequency) then a
DSP can remove it. (And, of course, so could a simple filter) If the
interfering signal and the desired signal are dynamically changing
their spectral distribution (the way in which the energy is lumped at
different frequencies at any given instant), then the DSP has to be
smart enough to dynamically change how it does the filtering. The
bottom line is that these efforts would be more rewarding in the IF
for several reasons. However, doing it in the IF requires a higher
degree of sophistication - i.e., higher sampling rate, etc.

Once you move into the audio world you have a similar task. However,
the stronger signal has already done something that is difficult, if
not impossible to undo. It has "overwhelmed" the desired signal.
It's the nature of the receiver's AGC circuitry and audio circuitry to
become "captured" by the stronger signal. That is less likely to
happen in the IF passband, because the IF passband is inherently less
susceptible to such overloading.

Therefore, given

- the handicap of dealing with signal to interference ratios
that have already been exacerbated by the normal receiver features,
- and the fact that it is much more expensive to do the
processing in the IF passband,
- and the fact that audio DSP can be "added on" as an
after-market product,

it's no wonder that there are few radios with DSP in the IF and that
they cost so much more.

Bob

Source record: 163504

I own an FT-920 and spent a full day at J.O.T.A. playing with an IC-756. I like the 756 better than when I tried it in the store. The display really turned me off when I first saw it but seems useful in practice. The 756 is $2K without optional filters. By the time you add the rocks it's at or above the cost of a Kenwood TS-870 which is also a nice radio and requires no optional filters.

I primarily work SSB and RTTY. The FT-920 with 500Hz filter does well (with or without DSP on) and the DSP works very well on SSB. I previously had a couple of outboard units so I'm very familiar with AF DSP.

As for "true IF DSP" it's a matter of opinion. Some people don't consider low IF DSP to be "IF." Others will point out that IF is IF and AF is AF - period. As for me if it's IF it's IF - high or low frequency.

Any of the current crop of mid-range radios will perform very well unless you have a very specific need in which case one may outperform the others.

I am looking for a 49 MHz 2-way radio. I am looking for one with externalized (mini plugs) mic and earphone. I would like to plug the mic input into my sound cards output and the earphone out into the line in.

The unit should be inexpensive, capable of one or more of the following:

49.830 MHz
49.845
49.860
49.875
49.890

The smaller the better, but low cost.

I would appreciate any suggestions on manufacturers and models and contact info.

Thanks,
Ray

That is my understanding of the 756's DSP, too.

My impression re chip DSP technology limit is that it is the speed of the A/D or D/A chips that are available at reasonable cost, not the cost of processors. I think the processors would still process audio frequencies .. and the results would then be reimposed on the RF signals.

Agree, Gary. My AF DSP is great at (for example) removing hetrodynes, but strong ones still desense the rcvr.

BTW -- my understanding is that the ICOM 756 has IF DSP but that it is still after the AGC. Think I read that in the QST review earlier this year.

I think the issue is not so much IF vs. AF but whether the DSP is ahead of the AGC.

I have a TS-570D and a JPS NIR-12. The NIR-12 wins hands down for SSB (fewer arifacts). But on CW the TS-570D's DSP is really fantastic (coupled with an otional 500 Hz Xtal filter).

My guess is that the ICOM 756 has better DSP. But I'm quite happy with the 570D plus NIR-12 (and find the 570D DSP to be useful on its own).

Source record: 163511

I've had both and both are good radios. The optional ATs for both are very effective.

The 706MkII has several advantages. One is that you can add both a CW and narrow SSB(1.9kHz?) audio filter. It also has a far superior noise blanker (essential for mobile use). The availability of all-mode 6 and 2 meter gives some mobile hill-topping options -- or you can play with 6 meter DXing from home. The 706MkII also has some really nifty "toys" in the menu system; the TS-50 is more spartan in this area .. and the menu system is not as easy to use (but certainly is adequate).

If price is a factor, you can pick up a good used TS-50 for around $600-700; new I suspect they are around $900 now. I sold mine to a friend for $700, including the AT-50 (which sells for around $300 new).

My main reason for replacing my TS-50 with the 706MkII was the desire for a permanent mobile installation (vs. sitting it on the passengers seat. In my small Honda, the removable/remotable front panel was essential!

Maybe because it works? Damfino but last evening I dl'ed the demo
software and wasn't impressed with GUI, it's not real intuitive much
less Win95 compliant. Even if the software is 'free', the hardware
costs two dimes and deserves better.

I would like to hear comments from owner/users as to soft/hardware
issues.

SW55 for sale - radio in excellent condition. AM, FM and SW coverage. LSB
and
USB (plus AM of course) detection, wide/narrow selectivity, signal strength
display, low battery light, local/DX sensitivity switch, etc.... Unit stores
125 frequencies in 25 pages of 5 memories per page, with alphanumeric display.
Very convient for storing frequencies by station. Sleep times and five event
timer.

Radio comes with its own hard case, AC adapter wind-up antenna, manuals

$225 plus shipping in the CONUS. Leave e-mail to baxter@kuhub.cc.ukans.edu

Al sezz:

> How was this radio FCC type accepted, when it clearly violates
> FCC Part 15. It does cause harmful interference.

On the contrary, my friend...
It can easily pass the Part 15 FCC EMI verification testing, or the European standards with radiation at much higher levels than would cause problems with a ham receiver in the vehicle. The threshold of radiation permitted by the EMI standards is well above (>20 or 40db) the reception level with a good receiver at point blank range.

Think about it... If you can pick it up on a test range at 30 feet with a relatively insensitive EMI lab receiver, you will certainly be able to receive it on your .1uV sensitive 2meter rig. There are many peaks which are seen on the spectrum analysis of equipment all the time that get the verification stamp of approval, because they are below the "limit". Remember, inverse square law applies here. Unfortunately they have a harmonic of their micro or display bus smack dab on .52, the frequency advocated for calling and monitoring!

The radio would have to have "no RF emissions" in the 2meter band to go unnoticed by a ham HT or mobile rig installed in the vehicle.

If substantially "no emissions" was a requirement for EMC compliance, there would be only very low frequency clocks on microprocessors! The software engineers would have to *work* for a living, and microsoft would not be a factor. :-)

Betcha Chrysler bought this car radio from somebody who designed it in Taiwan from building block ICs designed in Japan, and built it in China or Malaysia or a maquiladora. Chrysler didn't design it.

Published: Saturday, October 18, 1997
Section: Broward News
Page: 1BR

DEALER
IN POLICE
RADIOS
ARRESTED

ANNE MARTINEZ Herald Staff Writer
The Miami businessman who tried to take Hollywood's police radio tower earlier this year was back in hot water Friday.

Metro-Dade Police arrested Alan Leonard Friday afternoon in his North Dade home and charged him with dealing stolen property, a second-degree felony that carries up to a 15-year jail sentence, police said.

``He programmed radios with Metro-Dade frequencies and sold them to people,'' said Detective Steve White, a member of Metro-Dade's Economic Crime Bureau and High-Tech Crimes Squad. ``We don't even know how he got hold of the program software to do this.''

Leonard, who already is on parole on a second-degree murder conviction for his role in an attempted robbery in 1978, was being held Friday at the Dade County Jail. Police notified the parole commission of Leonard's arrest and would likely revoke Leonard's parole and deny him bail, White said.

The FBI has been investigating Leonard, 39, for computer fraud and copyright infringement since December, when agents raided his home and business and seized a stash of Motorola radios, computer equipment and diskettes.

Metro-Dade jumped in several months ago when they took a statement from a man who said he bought two modified radios from Leonard for $1,300, according to an affidavit filed Thursday in the 11th Judicial Circuit Court in Dade County. The man turned over the two radios and was not charged with any crime.

``It's not like [radio] scanners where you can just listen to what's going on,'' Dade Assistant State Attorney Karen Gilbert said. ``They were able to transmit. That's what was dangerous.''

FBI spokeswoman Anne Figueiras said the agency is continuing its investigation and may file additional charges.

With access to Motorola software, Leonard was able to produce, use and sell radios that can access -- illegally -- the Motorola communication system

used by the FBI, Metro-Dade and other local law enforcement agencies.

Leonard made headlines in January for trying to seize Hollywood's communications tower, claiming it was part of a surplus of communications and radio equipment that he bought from Hollywood in December 1995 for $500.

The tower was included in a three-page equipment list attached to a contract signed in 1995 by Leonard and the city's purchasing director. City Manager Sam Finz said that list was never part of the original agreement.
The embarrassing episode was resolved when Leonard eventually signed an agreement releasing any claim to the police tower or any other towers owned by the city.

``It was ludicrous,'' said Finz, who added he was not surprised that Leonard was arrested. ``I'm pleased to say we have nothing to do with him anymore.''

Herald staff writer Amy Driscoll contributed to this report.

What filter were you using (the one that didn't work)?

>Instead of using a bandpass filter to clamp down the intermod, their
>filter puts a 58 dB notch (attenuation) to the 152 - 154 MHz, the paging
>service frequency band. This amount of attenuation will normally
>translate into a large 2M bandpass filter.

How expensive is the Par Electronics filter? Is it passive, or does
it need power? (All of the filters I've seen are either passive but
large (e.g. DCI) or small but need power). How much power can you
transmit through it?

>My IC-2000H is **NOT** an intermod fighter as ICOM claims. It gets
>whatever my IC-T22A gets. I don't care the lab test results and the
>printed specification but in reality they are the same to me. Unless the
>handheld is also an "intermod fighter", then the IC-2000H should get what
>the IC-22A gets.

Well, keep in mind that a mobile rig must have much better intermod
filtering than a handheld just to get the same intermod performance,
since the mobile rig is usually used with a much better antenna than
the handheld is.

Dave

1458. Old IC-706 Question Revisited

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-22 00:00:00 UTC
From: jdonimi@aol.com
Message-ID: <19971022045301.AAA28674@ladder01.news.aol.com>
Source record: 163420

Hey gang,

I recall reading a flood of postings on the IC-706 shortly after it was first released. In particular, I'd love to get those old informational messages, if anyone kept them. Here's the questions I'm looking for:

1. What was the reason for offsetting the TX carrier by -200? I just bought a used 706 and it was set that way when it arrived, but I'd like to understand the reason and what symptom is this setting curing?

2. What was the deal with the microphone? As I recall, you can't use a Heil headset with the 706. Is that because the Heil uses a dynamic element and the 706 is designed for an electret?

Anyway, these wheels have already been invented. All I need is for someone to dredge them up from the depths of their hard drive...

Thanks and 73,

Jeremy W7YG (ex WA7YGB)

>you actually tell a difference between the two systems if you were
>blindfolded... and what would that difference be?

There are two reasons to prefer that the DSP be at IF rather than at
baseband AF. The first reason is that it will be (or at least can be) inside
the AGC loop of the receiver. Since the DSP will typically be the narrowest
filter in the system, putting it inside the AGC loop will prevent "pumping" of
the AGC by out of passband signals.

This can be very important if there are strong signals near the one you are
trying to copy because the pumping can make the signal you want to receive
disappear as receiver gain is varied by the AGC. But there is a downside to this
too. Because DSP filtering introduces a delay (sometimes a signficant delay if
extensive processing is done), AGC action can become "squirrelly", with large
overshoots and undershoots due to the lag in response. So there are pluses and
minuses to having the DSP inside the AGC loop.

The second reason may or may not be important. By doing the filtering
before demodulation of the signal, effective SNR can be improved,

sometimes dramatically. Some systems actually implement the demodulation function in DSP too, so near ideal demodulation can be done. This can greatly improve the ultimate weak signal ability of the receiver (provided it isn't already limited by other factors such as a poor front end noise figure).

Once the signal is demodulated, certain information about the signal is lost and cannot be recovered by post-demodulation processing. So a baseband (AF) processor is faced with a garbage in--garbage out situation. This is mainly significant when working near the noise floor, because that is where the output of the demodulator will be most uncertain. For the relatively strong signals most often encountered on HF, this is a moot issue. But if you care about working the weakest signals, you'll want to achieve as close to a matched filtering situation as possible *before* demodulation.

Note that for some forms of modulation, use of a product "detector" isn't really demodulation. It is just another mixer doing frequency translation to a very low frequency IF which happens to be in the audible range. Thus use of audio DSP on this sort of signal still conveys the effective SNR improvement benefit of IF DSP. An example of this sort of signal is a SSB signal.

An example where actual demodulatin is required is DSB AM. AM has to be envelope detected (or synchronously coherently demodulated), rather than being product "detected", for the baseband audio to be recovered. So you want the DSP applied before the demodulator for this type of signal. (This is mainly of interest to the SWL today.)

Note, if you are trying to decode CW, it is also DSB AM, and must be envelope detected to recover the baseband modulation, IE the pulses of the transmitting key whose timing encodes Morse. This is done with a demodulator called a *slicer*, so you want the DSP matched filtering to occur before slicing to get maximum effective SNR benefit from the DSP.

We don't often think about this because, when receiving CW manually, we do the slicing in our heads rather than with a hardware diode detector as we do for AM voice (in this case the receiver product "detector" is just acting as mixer converting the modulated signal to a lower "IF" which we have conditioned our brains to *both* demodulate and decode). But if you are trying to machine decode Morse (or any other discrete code transmitted by OOK), this can become painfully obvious if you try to demodulate (slice) before match filtering.

In summary, an audio DSP does the same thing for us as an IF DSP if we are using it for SSB or *manual* OOK Morse reception, both of which are "demodulated" in the brain. For other types of signals, IE various types of DSB AM or FM modulated signals, we need the DSP to be before the demodulator for best effective SNR. Having the DSP inside or outside the AGC loop must also be considered (though

note that if you use audio derived AGC, an AF DSP still can qualify).
Probably the best reason for wanting the DSP at IF is that it can also
serve as a near ideal demodulator for the types of signals which require
demodulation in the receiver (as opposed to in the brain).

Subject: Another Stupid Mitrek Question-nothing happens!

Hi Dan and the Group,
Thanks for your response.
I investigated and found no positive wire at pin 19. I only have the
channels plug and
the plug to the radio and big pos and negwire. I hooked up 12v+ to pin
19 and nothing. A
closer look on the knob side of the board shows a resistor hooked up
to pin 19 patching
over to I believe pin 13 < which doesn't have a wire leading from its
exterior terminal
either . the black resistor was split right down the center. This
resistor was small and
not mounted to the board, but soldered to the pins. I cant tell what it
was, any ideas what
the rating on that resistor would be?
my control head number is TCN1112a-2. a picture of my actual control
head is at
http://www.ads1.com/cole/
Once again, I am thrilled with any comments or help offered!!!
Cole

John Buck and several others wrote:
>
Lots of very good info on Nicads >snipped<

A few added comments from personal experience

There seems to be many grades and qualities of Nicads. This doesn't
always follow a single brand or cost and I have seen batteries of a
certain brand that seemed very good, and some of the same brand that
were junk. Something in the internal construction and materials used
apparently determines, in part, the longevity and I know of no way the
consumer can determine this in advance, but it sure seems to be a fact.

Example: 3 years ago I purchased a new 8mm camcorder that came with a
single Nicad battery. At the same time I purchased an inexpensive
universal type aftermarket Nicad battery at Walmart so as to have a
backup always available. The factory original failed in just a couple
months, shorted. Note that I had been very careful to NOT overcharge it
nor fully discharge it. It was replaced under warranty. The replacement
battery failed (2 of 5 cells shorted) within a year. Meanwhile, 3 years
after purchase, the cheapie aftermarket unit is still going strong.

I worked for many years for a public safety agency which used large
numbers of Nicads, mostly in handie talkies and rechargable flashlights.
Almost all devices were left on "charge" when not in use. Nicad failure
requiring replacement was a routine part of nearly every day. Some
batches of batteries do just hold up better than others, leading one to
wonder how they are different internally.

Heat is a major cause of failure, often caused by overcharging or
leaving a battery on the charger indefinitely. Sometimes overheating
causes venting and leakage of internal electrolyte. Other times, a cell
or more than one will short internally. Several years ago I attempted to
restore some of them by burning the short open with a short duration

high current pulse, but this never lead to a reliable recovery.

I never leave a Nicad powered device on charge mode longer than the instruction manual specifies since I am convinced that longterm or too-fast charging in most cases causes the conditions that ususally cause failure in *good* quality nicads, though there is no certainty that treating them properly will insure their longevity, as in the camcorder case above.

It has been said that one cannot solder to a nicad cell. I have done it successfully many times. One must remember that you *MUST NOT* overheat the cell, or it might leak, vent or in the extreme case, explode. You must use a LARGE solder iron/gun, get it quite hot *BEFORE* applying it to the nicad surface, then (after scraping the surface with a knife on the intended spot,) tin the spot.**BE VERY BRIEF** with the heat contact. After you have a tinned spot, it is very easy to quickly solder a wire to the cell. Remember, *Very Limited Heat Contact* with the cell.

With care, I have been able to rebuild many nicad packs or reuse good single cells that were otherwise destined for the dumpster (now the recycle bin). One must be careful to be certain that your added wires do NOT cause the cell to short from the tip end (usually the negative post) to the metal case. Sometimes their is very little insulating cleareance. Short circuiting a charged Nicad will cause it to get VERY hot, so hot it can burn you (experience talking) and could even explode.

You can still obtain the MIZUHO SSB/CW hand-helds on the used market, and probably on the new market in Japan (I saw them for sale in a number of places last spring when I was in Akihabara area). They have their limitations (1-2 watts, and two 50 kHz VXO band segments you choose), but they indeed will be fun to use once F layer improves. The rigs have been made at various times in recent years for 40 meters and EACH ham band between 20 and 2 meters (all SSB/CW, some 1/4 and some 1 watt). In addition, a tiny company in Japan "NISHI MUSEN" currently makes 1 watt SSB hand-helds for 144 and 430 MHz (the 430 MHz can be moved to 432 with a crystal change), and a 144<->1294 MHz transverter (which can likewise be moved to 1296 MHz with a crystal change). The latter have never been imported to USA but can be had in Japan. There is one other option here; the TOKYO HY POWER THP-750 (was written up in a QST article a couple of years ago); it gives you 40, 15 and 6 meters in a large hand-held package, and uses a synthesizer rather than a VXO so it covers the entire 40, 15 and (50-51 MHz) bands, with 2-3 watts output possible.

Here's how to fix it.
You need a 1/16 inch drill bit NO DRILL, just the bit.
Drill a hole BY HAND in the lower LEFT most "speaker hole". Drill very carefully BY HAND, and stop as soon as you drill through the plastic case.
Got this info when I bought my T2A from Rad-Comm. Takes less than 2 minutes!
The mike element is located behind this hole, so drill carefully and BY HAND.

1463. Voyager/Caravan Radio Interference to 2 Meter radios

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-22 00:00:00 UTC
From: aor@gteais.com
Message-ID: <877523766.3113@dejanews.com>
Source record: 163425
Cross-posted to: rec.autos.makers.chrysler,rec.radio.amateur.equipment,rec.radio.amateur.antenna

I thought I was the only one, until a friend said that he had the same problem with his van. In fact, you can walk through the mall parking lot with an HT and find all of the Chrysler products with this model AM/FM/Cass radio!

I have a 1989 Plymouth Grand Voyager. I recently noticed a strong carrier on 146.520 simplex frequency from my house. I took my HT and started walking around the house looking for the source. It was coming from the new van I had purchased. I opened the hood and "sniffed" the engine compartment. The interference was stronger with the key in the ON position. It turned out, that the AM/FM/Cass player was the problem! It appears to originate from the digital display on the radio. Pulling the fuse on the radio eliminated this problem. Hmmmmm..... The signal is stronger with the key ON because the digital display os on with the ignition switch. Very Strong!

The problem is so severe that it occurs every 500 kHz! I hear it on 144.020, 144.520, 145.020... etc., all the way up to 162.020!!!

I could not believe it! 146.520 simplex was unusable! I took the center console apart and wrapped the radio with aluminum foil tape, put ferrite beads on the leads, used heavy double shielded (foil) coax, and an outside antennas mounted thru the roof with the NMO mount. This eliminated much of it. The only solution is to put and on/off switch to eliminate all power to the radio when on 52.

Is there a factory contact for Chrysler Corp. I gave my name and callsign at the Dayton Hamvention this past year, but they always seemed to escape this issue. Even the Chrysler Hams began to run on this one. I need some friendly help with this issue from the factory. Any leads or contacts??

How was this radio FCC type accepted, when it clearly violates FCC Part 15. It does cause harmful interference.

73, and see you on the bands (not on 52 simplex, yet!)
Al, NW2M

1464. Re: Th-78 Vs TH-79

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-22 00:00:00 UTC
From: Chris McKendry <kh2pm_remove_to_reply@netpci.com>
Message-ID: <344DCD42.4E08@netpci.com>
Source record: 163426

I have both Kenwood TH78 and 79ad. The 78 has a clock, which is handy if you want to use the radio's alarm function. I take my 78 with me traveling and use the alarm function to wake me instead of a hotel's wake up service which is basically unreliable. If you can find a TH78 then buy it since they are no longer available from Kenwood. The TH78 is a "classic" as far as I am concerned.

My TH78a :
Receive:50-179.99,300-400mhz in vhf vfo
400-500mhz,800-1000mhz in UHF vfo (cell may be blocked)

Note: receive from 50-118 is weak and will not do FM-Wide (fm broadcast).

Receive of Aircraft band is good, and the radio is modifiable for MARS/CAP but you need to get the correct diode from Kenwood and do some surface-mount (SMT) soldering which is best left to an expert.
There is an optional chip for memory expansion which allows for up to 250 memories (ME-1) and there is a CTCSS chip that is optional that allows the decoding of CTCSS tones (TSU-7).
The TH-78 can be cloned with another 78 via audio link but that is a feature I have yet to use.
Both radios have CTCSS encode (transmit), DTSS, PAGing functions and wide band receive. The -79 has a convenient menu funtion and help guide so a manual is not really necessary.
My -79ad receive is:

vhf:118-174, 300-399mhz
uhf:410-469, 800-999 mhz

Transmit: 136-174 mhz and 410-469 mhz

You should be able to find out more on the www: go to this link:
(TH-79ad)

http://www.kenwood.net/products/display.cfm?newname=TH79AD&name=TH-79AD&selection=Amateur&search=th79ad

This next link is for the TH78a and concerns modifications to the radio:

http://oak.oakland.edu/pub/hamradio/mods/kenwood/th78a-1.mod

Good luck!

>
>Thanx in advance -- Pete -- KA2YDY

I have a FT900/CAT and the Yaesu claims the SP-8 is supposed to be the
matching speaker but is about an inch higher, about the same width, and
about 11 inches deep. Actually I could just about fit the rig in the
speaker! ;-). Cosmetically is close, works great, although I liked the
sound of my old SP-520 better. The filtering in it is somewhat helpful
fidelity-wise flopping between SSB to CW. In combination with it's filters,
my DSP, and the rig's built-in 250hz Collins mechanical cw filter I'm content!

Consider the GAP series of antennas. I have a DX-VIII which covers
8 bands, 2m/6m/10/and up to I believe 80m.

You can find ads for these in QST, and I believe mail order Amateur
Radio outlets like AES have them for sale. Try this link and look
for GAP Antennas:

Call Yaesu directly. They'll send you out the manual in just a few days.
They have always had good customer service.
You can find their telephone number in any ham catalog that has the
fullpage add.

Hello, Bryan--
The 7036 appears to be nearly identical to a 5915 heptode, but it (the
7036) is packaged in a taller envelope and according to a Sylvania tube
manual, offers 0.9 W plate dissipation compared to 1.0 W for the 5915A.
A 6BE6 has the same pinout.

Could anyone give me a handle as to what these items are worth in their present condition in dollar value. I'm clueless.

So I'll have some idea of what I can swap them for if at all or use the cash to buy a tube tester . I was looking to obtain a military type tube tester (I-177, TV-2, TV-3, TV-7,etc.) or a Civilian Hickok model or maybe a B&K tube tester.

ELECTRONIC TEST EQUIPMENT (All need repair)

1. GE SWEEP GENERATOR Type ST-4A. This is a real oldie. Needs repair. Good forsomeone who's into old radios and wants to add flavor to his/her repair bench of with an old piece of equipment. This unit has no manual or accessories with it. It's in average condition for it's age I would guess.

2. HARRISON 6290A (HEWLETT PACKARD) DC POWER SUPPLY. 0-40 volts & 0-3 amps. Needs repair. No manual or leads, etc. just unit. Probably needs output transistor. Cond. is average.

3. HP 6207B DC POWER SUPPLY. 0-160 volts & 0-.2 amps. Needs repair. No manual or leads, etc. just unit. Probably needs output transistor. I sold the identical sister unit of this item to a tech and he said the repair it needs it relatively easy (with knowledge of the unit of course). Very nice condition.

Any thoughts on the above equipment is appreciated.

Thanks,
Lance

Cross-posted to: rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.scanner

I am moving from my home in Staten Island, NY this week and must liquidate a lifetime collection of Amateur/SWL gear, scanners and hi-fi equip. List includes Hammerlund SP-600 receiver, Drake R4B, Kenwood R-1000, Hallicrafters S-180, RCA Marine direction finder (great for BCB), Universal M-7000, AEA PK-232, military Panadaptors, and more (many Bearcat scanners and tuneable VHF-UHF sets also).

Also Luxman Graphic EQ, Phillips Stereo TV, Allison speakers, Thorens turntable, Haffler amp.

Please e-mail me (with your Phone# if possible) if you are interested as gear is available by appointment only THIS WEEKEND (Oct. 25 and 26, and possibly Friday too!).

Everything MUST GO and most is in excellent cosmetic and working condition. If it is not working, make me an offer and chances are I will take it.

Looking forward to seeing you THIS WEEKEND.

Paul

1478. Notch out intermod. Was(ADI/Premier AT-600 HT(long))

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-22 00:00:00 UTC
From: "David Ho (AF4BH/VR2UE)" <davidho@one.net>
Message-ID: <Pine.LNX.3.95.971022095641.26141A-100000@shell.one.net>
Source record: 163440

I used to use a bandpass filter to help reducing the 2M intermod but found useless to me. Moreover, I needed to use 2 switches to bypass the filter when I want to monitor the air traffic control and local public services frequencies on 460 MHz. It was very bad especially when I was driving. The worst thing was that it DIDN'T get rid of the intermod as I expected it to. It might have been a bad filter that didn't have the correct roll off frequency or for whatever the reason. It wasted me $80.00 dollar for the filter and 2 extra switches until a fellow ham (Bill, NM4A) told me about a little wonder from Par Electronics.

Instead of using a bandpass filter to clamp down the intermod, their filter puts a 58 dB notch (attenuation) to the 152 - 154 MHz, the paging service frequency band. This amount of attenuation will normally translate into a large 2M bandpass filter. Sure enough, this notch filter is made A LOT smaller than my original bandpass filter and is smaller than the battery pack you have in your AT-600. Excellent size for handhelds and mobile rigs.

Unlike a bandpass filter, which will impede your wide band receive on 2M (outside of 144 to 148 MHz) and 70cm operation, the notch filter has unnoticeably performance degradation. I have 2 of this thing. One is working with my IC-2000H and the other is working with my FT-8000R. Both perform as expected during mobile, at least in my area.

My IC-2000H is **NOT** an intermod fighter as ICOM claims. It gets whatever my IC-T22A gets. I don't care the lab test results and the printed specification but in reality they are the same to me. Unless the handheld is also an "intermod fighter", then the IC-2000H should get what the IC-22A gets. Hi hi... I called ICOM to ask for help and the tech gave me some info on how to mod the IC-2000H. The mod is basically to reduce the sensitive of the receiver and that's not what I wanted and I think it's unacceptable. Too hot a receiver? Maybe!

My FT-8000R is about the same, no better or worst. At least Yaesu is a little bit humble on this and doesn't call it the "Intermod Fighter".

Back to the filter. The bandpass filter might help in certain types of intermods and might be good for certain types of applications. But my notch filter does exactly what I want it to do and better!

Just a thought... If the notch filter that notches out intermod and be made so small and effective, why not having it build-in inside a 2M rig and claim it to be the best intermod fighter?

Best 73!

This alters the low frequency response in transmit by effectively shifting the
filter passband relative to the voice signal. I find the -200 Hz setting
doesn't sound right with my voice. Since the low frequency components
of speech carry very little intelligence, shifting the Tx carrier can actually
result in a signal which is harder to copy and understand. This is one of
those don't do it unless you really need it sort of things.

>2. What was the deal with the microphone? As I recall, you can't use a Heil
> headset with the 706. Is that because the Heil uses a dynamic element and the
> 706 is designed for an electret?

Yeah, the Heil element doesn't have enough output to drive the radio, and
it gets really unhappy about the +8 volts phantom power the IC706 supplies
on the mic line. If you preamp it and DC isolate it, you can use the Heil.
This is true with virtually all Icom radios. Heil was supposed to offer a
preamped model to address this, I don't know if they ever did. I *like*
the nice flat response of electret mics.

The stock mic is actually pretty good, but it is designed as a noise
cancelling mic for mobile use. You have to really close talk it, and
speak up a bit, in order to properly drive the radio. The Icom preamped
desk mics work fine with this radio (you need the adapter from 8-pin
to RJ45 to hook them up).

Yes!!!!! Had an older 202 and sent it in for service and it was more
than a new one. I had heard that if it says "RADIO SHACK" across the
front as opposed to "REALISTIC" that the problem was supposedly
repaired. I bought another one on sale and bought the 5 year warranty
just in case. Other than that it has been a good radio. The problem with
the older one was it had a horribly high noise level on rx and tx. The
new one works great.

Interesting problem there, but sorry no help here. Just wanted to
relate that I've also noticed the same phenomenon with several other
Chrysler products and with Saturns. Every time one pulls up within a
couple of car lengths of my VW, 146.520 is splattered with noise.

Good Luck and

>

Actually I was wondering if there would be such a radio for quite a while. Something in the form factor of the "luggable." With 10m/6m/2m/70cm SSB & FM Maybe even AM. (WIth provisions for another band like 33 or 23 cm.) At a reasonable power output 15-20w from a gel cell & 50w from a power supply. Something that could be portable if need be but able to be used as a base station without being an embarrasment to the owner :) . Unlike the singleband all mode radios from yaesu that do a whopping 2w mobile (an HT does better) . With the tech & tech+ class licenses being the most popular around...the ham companies seem to be quite reluctant to produce rigs that satisfy this niche.. The icom 706 is fine..but it only has usefulness to me on 10/6&2m. & isnt portable as a standalone. Also, if you're wondering about the power output regulations, luggables fall under mobile radios not portables, so they can get away with having a higher power output.

Hello everybody, and thanks for reading. I have for sale:

Kenwood TH-22AT 2 meter HT along with...

* new PB-32 NiCad battery pack

* BT-9 alkaline battery pack

* SMC-31 speaker mike

* wall charger, belt clip, and lanyard

* OEM rubber duck

* original box and manual

This is a full-featured, menu-driven HT that easily fits in your shirt pocket. It has 40 memory channels, one call channel, CTCSS, DTSS, and a complete DTMF keypad. It also features three transmit power settings, which includes 5 watts output, frequency and memory scan, and much, much more.

This is a neat little rig that has served me well, and will do the same for you. It's time for me to upgrade, and this is part of my fund-raising effort. The radio is fully functional, clean, works well, and I'm sure will be a valuable addition to your ham radio inventory. It was for mine.

Asking $250.00. All reasonable offers considered.

If interested, send me an email.

73

1508. FT-840 Meter HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-23 00:00:00 UTC
From: aczepczy@d.umn.edu
Message-ID: <344FCA54.6C30@d.umn.edu>
Source record: 163321

Hello,
I'm a bit conufsed by the meter on a FT-840. The transceiver is hooked through a tuner to a Carolina Windom. When I increase the power I have to forward power displays. One on the radio, and the other on my tuner (MFJ 949-C). There seems to be difference of opion betwenn how much power is being put out. My tuner alwasy shows approximatelly 25-30% less than my radio says. At full power (radio capable of 100W) the tuner says 75 while the radio says 100. I'm using a power supply slightly underrated for this radio? Any suggestions.

P.S. I thought that the power meter on radio may be voltage driven because they match up to about 50 watts then radio goes up, while tuner stays the same.

I'm not sure why you called this a "white face." I thot they were all gray. Anyway the plug requiring a jumper is the 9-pin external VFO plug. And the jumper goes between pins 8 and 9. If you have the VFO-520 plugged in, then no jumper is needed.

>and/or ideas on where to look for this info!!
>
>
>CHeers!

I have recently gone through a selection process for a radio myself. I purchased an Icom T2A unit several weeks ago, and soon found out there was a design flaw that caused the transmit audio to be all mid-range. My suggestion is to steer clear of this model. I would recommend the HTX202. I have had many, many hams tell me about the quality and ruggedness of the 202. I now wish I had purchased one instead of the T2A. Live and learn.

Check out some of the back issues of QST magazine. They provide reviews on equipment that can be very helpful.

Hope this helps.

Most sweep tubes that I have always used in my Drake fail to last
more than 2 or three years. I converted the 6JB6's in my T4XB and
have had them in there for more than 2 years and no loss in power out.

>a speaker-mike. Is there any info stating how ICOM fixes this and exactly where
>they put the mic in relation to the speaker? Couldn't one fix his own radio?

Here's my experience with the T2A. As I posted a week or so ago, I was
getting reports of sounding like I was "talking through a tube." I
called ICOM, spoke to Gary in their tech support (very helpful guy) ,
and was immediately told that there is a design flaw in the radio. He
had no hesitation as was reported by another poster in this thread.
Further, there is not supposed to be a hole over the mic element.
Instead, sound is channeled through from the speaker holes.

Problem is, the mic isn't in the right position to receive the sound.
The factory fix, according to tech support, is to place about an 1/8th
inch spacer underneath the mic element, pushing it closer to the front
panel. They also tried drilling, but found this solution is better.

I sent my two radios back to ICOM just last week, and got the modified
units back today. Audio reports from the local repeater are that the
unit "sounds like a big mobile rig." Can't complain about that.

ICOM is not promising turn around that is that fast--they say ten
working days plus shipping time. They were much faster than that in my
case.

Nice radio.

>
>How expensive is the Par Electronics filter? Is it passive, or does
>it need power? (All of the filters I've seen are either passive but
>large (e.g. DCI) or small but need power). How much power can you
>transmit through it?

$66 bucks that's including the UPS ground track shipping. That's
considerably cheaper than the DCI [Bandpass] filter. This notch filter
does not require external power and it handles 50W according to
specifications. The following is the description of the notch filter.
You can read it and find out. It does a better job than I to explain
it.

[==== Beginning of quote ====]
Congratulations on your purchase of the Par Electronics 2 meter
intermod filter. This patent pending filter is the first to use
bandstop topology to solve the problem of front end overload. Other
filters use a bandpass approach centered about the 144-148 MHz
spectrum. Results with this topology are mixed. If the bandpass
filters are made conveniently small the insertion loss is so high that
they require +12V to bypass the filter out during transmit. In order
to bring the insertion loss and VSWR down to an acceptable level, the
filters must be made large. Finally, the bandpass approach eliminates
ALL the spectrum outside the 2 meter band thus making it impossible to
receive the 135-174 MHz band on those transceivers so equipped. The
VHFDN152 allows unimpeded reception of all VHF/UHF except 152-154 MHz.
[==== End of quote ====]

Specifications:
Design Impedance: 50 Ohms
Max. Stopband attenuation: 50 DB
2M VSWR: 1.25:1 Max
70CM VSWR: 1.3:1 Max
Power Handling 2M/70CM: 50W
Typical in band insertion loss 0.3db

>the handheld is.
>
> Dave

I tested both my IC-2000H and IC-T22A with the same 1/4 external antenna parked downtown 4th & Main, Cincinnati. I monitored 4 different offending frequencies and both of them receive the same signal. No, I didn't compare the S meters on both rigs but as long as the intermod broke the SQL, I knew that did it. Lab tests and specification might tell a different story but I count real life applications. The notch filter eliminated all and restored my reception.

While it is working for me, I don't know if it will work for you.

No. I don't work for Par Electronics. But I am one happy customer of theirs.

Apparently, Icom and the dealer I purchased my T2A from never could work out an agreeable solution. In fact, Icom send a whole new radio, supposedly corrected. The ham that initially reported the problem to me said the audio was much better, but it still wasn't the greatest. Oh, well, I guess this will do until I get another HT.

In my previous post, I had mentioned that I didn't know what was wrong with my filter. It just didn't get the job done right for me. It is nice to hear that your DCI filter works for you flawlessly. I had no intention to debate the effectiveness of a given bandpass filter, that's why I didn't mention what I was using in the beginning.

I used only known in/out band frequencies to get my *REAL LIFE* comparison. Let me clearify this: I tested intermod QRM only within HAM band, I don't have problem with any of my known out-of-band frequency.

Well, it is up to you to believe which rig is better and I am not intented to have a debate over it. I just don't have the equipment to measure which rig is better! Let alone comparing mobile and handheld rigs is enough to start a different thread.

In my situation with a mobile and a handheld, they are pretty much the same. The DCI filter didn't help for my unique case. Moreover, my help from ICOM was to reduce the sensitivity on the IC-2000H. There are many factors affecting my case including the quality of the bandpass filter, mobile, handheld, and the nature of the intermod. Don't jump to a hot gun that I am bashing any of these products, while I just offer an experience on my war against intermod.

>:FM broadcast radio, but is OK for 25 kHz deviation TV sound.

barryoXX@fastlink.com.au writes:
>A small correction. FM broadcast is 300Khz deviation an TV sound is 130Khz.

Not in North America. FM is 75 kHz deviation and TV sound is 25 kHz.
Source: Electronics Engineers' Handbook. Are things so drastically
different over there? If so, that would make broadcast FM receivers
from one area unusable in the other.

I attampted to gain extended RX and TX using the mod in which jumpers 0 and 1 are added. This did nothing. I then peeled back the upper part of hte sticker on the Pc board and removed jumper 4 (It is a 0 ohm chip resistor) This gained the extended receiver (complete 800MC) I then removed jumper 3 this gained the extended transmit. I left 0 and 1 jumpered from the previous attempt so I don't know if they really need to be jumpered. Hope this helps if the other mod had failed.

Date: 1997-10-23 00:00:00 UTC
From: gem <gem@netcom.ca>
Message-ID: <344FEC10.791C@netcom.ca>
Source record: 163405

I wouldn't change my TH78A for anything (well, maybe a Ferarri!).

With the 250 memory chip, I have programmed the following - permanently.

Major North American VHF & UHF Repeater pairs.

All European VHF & UHF Channels

Australian/NewZealand VHF & UHF channels (yes, I travel a lot).

ALSO: ALl the VHF Marine band channels (with the correct channel numbering e.g. channel 116 is marine VHF 16, and 184 is Marine VHF 84 etc.etc.)

My only complaint - this radio would be PERFECTION, if only I could change the MONITOR button to transmit a TONE burst like I think the TH78E can do!

I have two of them, and I will NEVER NEVER sell them. In fact - I might even buy a third.

The clone feature works really well - turn on both rigs with '3' depressed (tuned to the same frequency of course!), and press PTT momentarily on the master radio. All 250 channels go across on very low power (I mdo it on UHF to reduce QRM to others) in about 15 minutes.

Have you been looking for a really good quality short-wave car radio with stereo cassette? I was too and I'm delighted to say I finally found one. Freedom Radio has made a special purchase of the *finest* quality AM/FM/SW cassette car radios, and they have them in stock now for only $349.00. This is a special purchase and manufacturer will not permit name to be mentioned here, so call now for more details. Order now because they won't last long at this great price.

Call 1-888-778-2181 for more information

If you are looking for an extremely high quality car short-wave radio, don't pass this up or you will be sorry.

Are you talking about the "Clearnet" PCS mobile phone service in Canda?
Those mobile phones are 1900 Mhz CDMA, and you will not be able to hear
those at all.

Only if it is a CDMA receiver equipped with the proper spreading codes.
A narrow IF band scanner will deliver nothing except perceived noise.

m@s@ wrote:

> sigh..... I hope I can get some converters or something...

You're not listening to what people are trying to tell you. Let me try ----

It is not a simple matter of procuring a "converter" which are typically (in an RF sense) straightforward local oscillator(s), mixer(s) and filter(s) to shift the incoming signal's frequency into your existing receiver's input frequency range. That alone will not allow you to listen to the transmitted signal.

The Clearnet system sounds like it is fundamentally different than a traditional analog (i.e., AM/FM/SSB/etc.) receiver with its envelope/product/ratio/discriminator/whatever demodulation of the IF 'directly' into baseband audio. Instead it seems like it is a *digital* system, using digitized samples of audio transmitted with a CDMA 'spreading' scheme. Two different animals entirely....any 'converter' would (at best) demodulate the incoming CDMA signals into audio only to remodulate it onto an FM (for example) carrier at 150 MHz for your existing receiver to knock back down to 10.7 MHz, 455 kHz. etc. before passing it through the FM detector and into the speaker. Rather a roundabout way to go, even if it were available 'off the shelf'.

Take a deep breath, and think about this stuff. It all makes sense if you understand the principles behind it.

From: WA8DXK <russja@stratos.net>
Message-ID: <34516DB6.7C9843C5@stratos.net>
Source record: 163281

Hello All,

I have a KENWOOD 700SP all mode - CW-FM-USB-LSB-AM (YES)-for sale.
This rig has the Bright Blue digital readout, switchable receive preamp,
adjustable drive, RIT, Built in speech processor, non-Kenwood hand
mike,etc -2 to 12 watts out.. I would rate the rig a 7.5 out of 10. It
has some cosmetic flaws but works FB all functions. Sounds great on SSB
and
FM. I do have a copy of the service manual for the 700 series included.
It has a front panel switch to generate the older pulses but it is
easily
adaptable to the Communication Specialist tone board for PL.

ASKING $375.00 plus shipping

Russ --WA8DXK 440-333-4923 (bus)

1574. Apple 1 motherboard

Cross-posted to: rec.radio.swap,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment,

I collect early microcomputers. I would like to own an
Apple 1 motherboard. They are difficult to find and I am
willing to pay good for one. If you have one and might be willing
to sell it, please email me. I have a very
nice Altair 8800 that I can throw into the deal if you are interested
in getting one of those.

Thanks,

BOB

1575. Automatically search newsgroups - 218 1024221828 KYK

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-24 00:00:00 UTC
From: 324@690.com
Message-ID: <62rt1b$e8h@news2.triton.net>
Source record: 163283

Automate your collecting research!

News Rover is the ideal tool for searching through Usenet newsgroups for messages about items that you collect. Once you tell it what to look for, News Rover will scan a set of newsgroups and collect all messages that contain what you are searching for. For example, if you are interested in messages related to slide rules or calculators, you could specify a search expression such as:

slide rule or calculator

News Rover will then scan a set of newsgroups you select and collect any messages that match the search expression. This searching is completely automatic, so it works while you sleep, work, or play. The search expressions can be as simple as a single word, or they can be complex expressions with AND, OR, NEAR, and NOT operators.

You can download a free demonstration copy of News Rover from:

http://www.NewsRover.com

But News Rover is good for more than just searching collectables newsgroups. You can use it to search for family names in genealogy newsgroups, or for any other type of information in any newsgroups you choose. And News Rover is ideal for picture newsgroups. It decodes both UUencoded and MIME base64 images, and it combines and reconstructs binary files that are split into multiple messages.

Here are some of the key features of News Rover:

o Scans newsgroups you specify while you sleep, work, and play.

o Automatically downloads messages and attached files so that they are available for instant access when you are ready to review them.

o Decodes attached files of all types (UUencoded and MIME base64).

o Displays a picture gallery of collected thumbnail size images.

o Selects messages based on include and/or exclude criteria to help you find a needle in a haystack and eliminate spam. You can even use complex selection expressions with AND, OR, NEAR and NOT.

o Supports multiple "interest groups," each with sets of newsgroups, selection expressions, message database, and picture gallery.

o Remembers files already extracted and eliminates duplicates automatically.

o Saves parts of multi-part files, searches for the missing parts, and rebuilds the entire file when the last part arrives. It even combines parts found on different days and in different newsgroups.

o Allows you to post Usenet messages and send e-mail messages.

o Allows you to block all future messages from specified senders.

o Operates on a schedule you set up to use your phone line only when you don't need it.

o Automatically dials the provider and hangs up the phone when it is finished.

o Works with almost all Internet providers and news servers.

o News Rover is multi-threaded so you can read messages and view pictures while it downloads and decodes more messages.

News Rover was designed and written by real-life Usnet newsgroup junkies! With News Rover the news is ready when you are!

To learn more and download your free demonstration copy, visit:

http://www.NewsRover.com

News Rover is getting rave reviews...

D.G. says: I downloaded News Rover last night... I ordered this morning. I don't know how much time I saved. I give your product two thumbs up!!!

T.B. says: "Great Job!!! I tried your software for the first time today, and it beats Plukit-32 hands down!!

Cross-posted to: alt.ham-radio.marketplace,att.ham-radio,rec.radio.amateur.equipment,rec.radio.amateur.misc

I have an opportunity to buy a UHF UnidenForce repeater Model ARU-251.
Unfortunately, it does not have anay docs with it and don't even know the
power output (although I suspect 25 watts).

I would be happy to pay for a photoopy of the service manual/schematics as
niden no longer stocks the manual. I'll also pay for the programmer for
this unit too.

In advance, I appreciate any and all help onthis unit.

From: cdorn@gpu.srv.ualberta.ca
Message-ID: <62qotjddo1@pulp.ucs.ualberta.ca>
Source record: 163341

Hello,
I am interested in experimenting with 6M. I am considering the Ten Tec transverter, but it may not offer the versatility that I would like. I am interested in any comments regarding the MFJ 9406 SSB/CW 10W 6M radio. Wasn't there a QST review on this one? Is it a decent, basic radio for 6M DXing?

Thanks,
Chris VE6RDC

Hi Gary,

Heard of someone, here on the net, taking care of that problem by taking the wire back at the fuel tank, at the fuel pump, and wrapping it around a toroid.

Remember in a /M installation grounding, grounding, and more grounding

Dwight KB9JAI

Hi. I would like to know the freqs of Motorola's "Clearnet" devices.

We are using Motorola's rigs for the school activity, and I am interested in knowing the operating freqs.

Last time when I had that rig in handy, I tried to check the freqs by using the freqs counter... but it didn't pick up any signals. The freqs counter was supposed to pick up anything between 1 - 1300 MHz... so I was thinking that the clearnet might be using the microwave band...

The rig looks like a cellular phone. The antenna is also similar to those of the cells.

Thanks for your help !!!!!!!!!!!!!!

You could get around part of the timing issue by using an automatic shutoff charger. You could use the timer to turn it on when you're not using the system, thereby avoiding any RF interference. Or, you could just simply turn it on when you leave, off when you come back. A good automatic charger should shut off or go into a super low current trickle charge that can be left on indefinitely.

More likely, he is referring to the Clearnet "Mike" system, which is the same or similar to Nextel in the USA. It is the Motorola "IDEN" system (Integrated Digital Enhanced Network??). The Mike service from Clearnet is basically an 800 Mhz trunked radio system but using all digital transmission. you can get the frequencies for this from several sources (Try the Quebec haruteq scanner guide?). But its pointless as you will only hear data on your scanner (not voice). On the other hand, if you are using Motorola portable radios on one of Clearnet's conventional trunked SMR (Specialized Mobile Radio) systems, you CAN monitor this. You will still need to program your scanner with the trunking system frequencies, and the conversations will hop from channel to channel as the system is shared with other users. You have to first find out which of the three systems your school is using (Clearnet PCS, Mike, or regular trunked "SMR" service)

> Ed Dial - WA4RYW

You can find it on page #8 in the Owners Manual. It is as follows:

Pin 1 - +8vdc output
Pin 2 - Frequency Up/Down
Pin 3 - AF output
Pin 4 - PTT
Pin 5 - Microphone shield (ground)
Pin 6 - Microphone Input (center wire)
Pin 7 - Ground
Pin 8 - Squelch switch

Check out the mike you are wiring up for the actual function of each
wire rather than going by colors, then connect using the above pin
functions and all will be OK...

Note - Pin 2 uses one wire for both channel up and channel down, by
changing the line resistance depending on which switch is pushed. See
the owners manual for the schematic.

73,

Dan K Nelson, KF6KNB

China Ham News 10/25/97
China on EME!

BY1QH, Beijing, confirmed three 2-meter QSOs on EME on Saturday, October 18, and Sunday October 19, 1997. The Tsinghua University Amateur Radio Club station ran 200 watts into a 4x9-element Yagi antenna.

In the first EME experiment, David, BZ1BM, and Lars, SM0KAK, had hoped to work VE7BQH and W5UN from BY1QH, but failed. They did work into Europe and QSOed with three SM stations. David and Lars also heard some DL, 9K and JA amateurs on EME, and are planning their second experiment shortly.

Please direct your interest in working with China on EME to David (bzibm@wg.chnmail.com), the student president of BY1QH.

Kenneth,

When on the page to programme frequencies, enter (say) 145.5000 Mhz
but use SHIFT KEY, do not use shift on the decimal place, and fill all
the unused remander with SHIFT zero.

The software will allow out of band freqs.

145.5000 mhz looks : !$%.%))))

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-25 00:00:00 UTC
From: Kevin Short <kevin@larson.com>
Message-ID: <Pine.SCO.3.95.971025161132.6694A-100000@ltiadm.larson.com>
Source record: 163181

I have an HTX-404 that has suddenly developed what looks like
an ink splatter in the LCD display. I have a warranty so I am not
to worried about it. My question is what happened? My thoughts
are that it could have been impact, static discharge, or possibly
spontaneous return to randomness [the LCD display just failed].
Any opinions ? Thanks.

One further note, my 706MKII shows there are two precision resistors in the up/down pushbutton circuits, internal to the microphone. There is even a note specifying the tolerance requirement. Therefore just connecting a switch may not work. Again mine is the MKII model, but I doubt there is any difference.

1639. Autek Antenna Analyzer - Anyone use one?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-25 00:00:00 UTC
From: Chuck Hallett <w7lds@usa.net>
Message-ID: <345298EE.F5DACBB5@usa.net>
Source record: 163186

I'm considering purchasing an antenna analyzer and want to be able to determine the magnitude of both resistance and reactance, as well as classify the reactance (for H.F.). The Autek advertisement seems to indicate it will do these things, but they get a little mush mouthed about the reactance part, i.e. will do it for <5:1 SWR.

Anybody used one of these, and if so were you satisfied with the performance. I'd appreciate hearing from you. Please respond to both the list and me personally.

Tnx & 73s,

Chuck W7LDS

Chas;

I have the 706MKII for about one month now, and have run it mobile only. I had some old Hustler coils and mast which I haven't used in about ten years. I drilled a hole in the side of my Dodge Caravan and put a stout ball mount.

I commute from Detroit to Milwaukee on weekends and have been using this setup very successfully. I bought the triband adaptor and have the 75/40/15 meter combination. Yesterday I worked W7ASC in Phoenix for over an hour on 15 during the drive from Ohio with excellent results. I'm very pleased and get very good SWR (flat at resonance) with them. Love the rig and am very satisfied with the antennas. I was thinking about buying an antenna tuner but think I'll save the $300 - $600. I've been listening to 160 meters during my 7 hour drive and am thinking about getting a whip for that band as well.

Good Luck & 73s

I was thinking of buying several Japanese Radios in the low $2000 price class but am now considering the Kachina. I think many people on this newsgroup are sick and tired
of the poor treatment we get at the Dealers and Manufacturers. That is why Ten Tec is still in business. The moment I saw the ad for this New Radio I was excited and Sceptical as well. My bonus this year should be approx 2K so I may make the plunge.
Sammy.

_·_· _ _·_ _ _· · ·_ ·_ ·_ _ _ _ ··_· ·_

I need your collective "elmer" counsel as I am looking for a solid HF rig
in the process of rebuilding my shack.
The only semi-modern rig with which I am familiar with is the ICOM 735.
What other ICOM, Kenwood & Yaesu rigs are similar that are in the
same $500. and lower used price range?

Key issues:
1. 160-10
2. WARC Bands
3. Better than double conversion receive.
4. General coverage ok, but not necessary - I'll get a shortwave radio!
5. RIT, Notch, Passband helpful (Though I am getting a NIR-10 to 1help
kill QRM and QRN! I needed similar help with the 735.)
6. Quick tx/rx switching for digital modes, pactor, packet, etc.
7. External 12v power supply vs internal supply - preferred, but
not absolutely necessary (I'm planning to use a deep cycle or gel
with float charger - filtered to keep out noise)
8. SSB (usb & lsb), CW (AM or DSB for 75, and FM would be nice with a
transverter for 6, 2, etc. some day)
9. A few memories, nice, but not necessary (not operator memories,
frequency memories :-) Come to think of it ... never mind!)
10. Decent shape, but need not be museum quality.

Thanks for guidance, offers, etc.!

Message-ID: <19971025022200.WAA18959@ladder02.news.aol.com>
Source record: 163290

I have come accross several Watkins Johnson model 107-1 demodulators. They cover .1-10mhz and have provisions for external local oscillator, FM demod, video and a few other features not seen on conventional receivers. They came with DRO-302A2 digital readouts (external) and DRO-309A frequency counters. I would appreciate any info that you can give me on their possible configurations, usefulness, and current value. Thanks.

Source record: 163297

Greetings,
I have a RARE Kenwood R-820 receiver available for sale. This is the companion receiver for use with the TS-820(S) transceivers. When used in conjunction with a TS-820, It can be used as an external VFO with the ability to listen to a second frequency simultaneously, even on a different band! If you like to work split, this is the way to go.
The unit is in excellent to near-mint condition, in the original box, and comes complete with the owners manual and all cables to interface with a TS-820. The receiver is far superior to the one found in the TS-820 and has features such as VBT, Notch, NB level adjust, digital display, etc.
Price?...I'll let this cream puff go for $475 + shipping or will entertain offers for trades. If interested, I can be reached via e-mail at W9SDA@aol.com or most evenings after 7pm CDT at 414-547-5116.
Best
Regards,
Ronn

>sigh..... I hope I can get some converters or something...

Well, most people who use cellular phones don't *want* people listening to their conversations, so don't expect it to be easy. In the past it was, because the creators of the North American cellular system were lazy, and used plain analog FM modulation for phones. Since this is exactly the same as what was already in use for almost all VHF and UHF voice communication (except aircraft), all kinds of existing scanners could receive cell phones.

But European cell phones have always been digital. To receive digital transmissions, you need different hardware - but a modified cellphone is exactly the hardware you need. However, the European system is also encrypted, so even with the correct RF hardware you can't listen to other people's conversations because you don't have the encryption key. I don't know which of the new North American systems use encryption. If they do, you can just about forget about listening to the conversations.

Personally, I wish the NA systems had been encrypted digital from the beginning, like European. Then cellphone conversations would always have been secure. As a result, there wouldn't have been these stupid laws in the USA which try to make receiving cellular frequencies illegal and difficult, which in turn means that most ham and scanner equipment sold in Canada lacks coverage of a particular chunk of frequency range.

Dave

By the way, MASA, your email address above is unusable. There is no .ham domain according to my local name server.

1674. IC W-32A Features?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-25 00:00:00 UTC
From: randx@imagin.net
Message-ID: <62tbkd$edb@w3.imagin.net>
Source record: 163310

I'm thinking about getting an Icom IC W-32A dual-band HT, but am unsure about some of the features that I want in and handheld.

1. Can it operate from external power? (I'm pretty sure the answer is "yes".)

2. Does it have dual single band receive capability, in other words, "UU/UV/VV". The manufacturers literature and QST review are both silent on this, but a couple of retailer ads (which I don't trust) indicate it does.

Thanks in advance.

1676. Info:on Icom IC-756 rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-25 00:00:00 UTC
From: "Dennis B.Sheaffer" <wy3f@postoffice.ptd.net>
Message-ID: <34523108.13271301@postoffice.ptd.net>
Source record: 163312

Hello,I am looking for hams who are using the new Icom IC-756 HF rig.
I am intrested in getting a few answers that Icom`s home page could`nt
help me with.
I own a 706 and I love the rig,I would hope that the 756 has more
features than the 706.

1.) Does the IC-756 have tone encode built in the rig for using 6mtr
repeaters?

2.) Can u turn off the 10khz digit on the rig?

I use to own a Kenwood ts-690,and i had to add a board to the rig for
tone,Then when u needed
to change the tone u would have to take the case of and do it through
dip switches.
I since upgraded to a TS-570s,and it has tone built in and no opening
the rig.
Real nice feature,On the other hand my 706 has it built right in too.
My local ham store is getting the Icom line, and I am pleased with my
706 that much I may be
in the market to upgrade my 570s to a 756.
The dealer that i bought my 570 had a demo 756 there, and i was pleased
with the little
bit of fooling that i did with it.

I was dissapointed to find out that i cant turn off the 10 khz digit on
my 570,but i could on my
690.
On my Icom i can turn off the 10 khz or make it stay at 0 .
I would be intrested in hearing from anyone using the IC-756,pros &
cons...
I read the review in qst but they did'nt mention anything about what i
am asking ?

1677. how active is the 902-928 ISM band

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-26 00:00:00 UTC
From: pshintani@demo.webtv.net
Message-ID: <631aut$jo4$1@demo-102.iap.bryant.webtv.net>
Source record: 163114

Hi:
Thanks for taking the time to read my posting.
I am curious as to how active the ISM band is, particularly the FM mode.
I assume that it is pretty empty since there is very little commercially
available equipment available. Here is my hint: in Japan there is a
citizen band located around 903 MHz, using FM. It's no longer that
popular so finding second hand equipment at a good price is not too
difficult. Perhaps this would be a good starting point for US hams to
get their hands on some 900 MHz radios . If this band is even modestly
active I would appreciate anyone's comments. I am particularly
interested in the acitivity in the southern CA area.
Perhaps if southern CA is active I guess I better start looking for
some equipment before I return to the USA.

>darrellk@iland.net
About 18 mos ago I purchased the AL-800H and am well satisfied with it. I liked it because it runs the legal limit with ease, is light enough for an old man to pick up and carry across the room without help, and it covers 160 through 10 meters.

The only problem that I've had with it is that a diode burned out due (I think) to some kind of a flashover in the RF compartment. The user's manual made specific mention of why this diode might burn out, and what the symptoms would be. That made it easy to diagnose and repair the problem myself. In case you're interested, it's a diode that is in the metering circuit that somehow helps keep the plate current and grid current metering separated. It also can be jumpered for either 110 or 220 volt operation - although I have only operated at 220. By the way, I believe that the QST review of the product erroneously report that the unit was only for 220 v.

I have a five pin, 25 watt, 32 channel VHF Motorola Maxtrac for sale. Was used only used for packet radio.There is a female mini plug installed in the side of the head. But other than that, the radio is in excellent condition. No power cable, but will throw in the original 2 channel head as well.

Will consider a trade for a 2 channel UHF mobile rig.

Thank you for reading this post.

Sincerely,
Chris KB2BBW

Source record: 163212

Hello All;
I am selling "like new mint" AEA DSP-2232 Digital Signal Processor
"Mutli-Mode Data Controller" few months old still under TW warranty
With all original boxes, docs, warranty card, receipt and etc. There is
absolutely nothing wrong with this unit and is basically new out of the
box. Reason is: I am selling all my satellite and amateur gear because
of seriously major financial problems. No More... No Less
Please Re Me Via: email n2rif@amsat.org Or
Packet N2RIF@WM2F.#SNJ.NJ.USA.NOAM.
You can also try calling but my phone is usally busy.
My ph# is 609-386-9382..
I am asking $445 + shipping obo.
Thank you for reading my bulletin. Thomas J or just T.j. -73

P.S. I have stated about TW not sending any of these out nor
selling them at $499 but it appears I have been lied to by TW.
So I am dropping the price. I paid $599.95+shipping just a few
months ago but I guess I've had the "u know whats" put to me.
Such is life I guess..

Date: 1997-10-26 00:00:00 UTC
From: rhibnick@aol.com
Message-ID: <19971026130601.IAA25675@ladder01.news.aol.com>
Source record: 163214

My TS940 has recently developed two intermittent problems:
All audio signals (SSB & CW) sound garbled/watery. And
From time to time the audio cuts out completely, and the frequency display goes blank except for a row of dots (decimal points). If you move the tuning knob, the audio remains dead, a frequency is displayed while the knob is moving, then the dots come back when you stop moving the tuning knob.
Other functions seem normal.
Any ideas where to look? The rig is abt 10 years old.
Thanks & 73,
Ray, WA9YYY

they used to be in the newark or allied catalog, i forget which. they
are apc-7. general radio (test equipment) might be a good source, as
they use them extensively in their microwave test equipment.

1713. FS:FT-530 Dual-band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-26 00:00:00 UTC
From: Unit 61 <zjohnablez@execpc.com>
Message-ID: <3453822A.5BD2@execpc.com>
Source record: 163229

Yaesu FT-530 Dual-Band Handheld.
Excellent Condition. Used as a base station.
Never dropped, scratched, etc.
Modified to work in the commercial bands.
Also receives AM Aircraft.
Cross-band repeat, and encode/decode built in.
FNB-26 & 27 Batteries. Both in good cond.
Yaesu MH-12a2b speakermic.
12 volt power cable.
Wall charger. (slow).
Original box and manual.

$330.00 or reasonable offer.

e-mail at above but remove z's from address

1714. *Low Voltage PLL Trick*

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-26 00:00:00 UTC
From: eugened@aol.com
Message-ID: <19971026155500.KAA07239@ladder01.news.aol.com>
Source record: 163230

Hello,

While I was playing with my Uniden Bearcat 210 XW 20 channel base scanner on a cold, rainy Sunday, I figured out what seems to be a "low voltage trick". As you may know, if you reduce voltage on a PLL chip, the chip get's all kinds of wacky signals from the radio, and therefor it may unlock blocked frequency ranges. The BC-210 normally covers 30-50, 136-174, and 406-512 MHz. This is the trick that worked on my 1979 BC-210 scanner: I program all 20 channels with frequencies close to the band edge, then, while having the scanner in scan mode, I slowly reduce the input voltage, first the LCD screen goes out, then the audio dies, and about at this point the PLL unlocks, at this point, you must IMMEDIATLY give the radio FULL 12 volts. (You must NOT let the voltage drop too low, or the radio will reset itself to preprogrammed freqs). Now the scanner is probably in scan mode again. Put the unit in Manual Mode and go through all the channels manually, and see if any of them now have out of band freqs programmed. They probably will. Let's say that channel 11 has 216.287 MHz programmed in. The low end of the UHF band on the BC-210 is 406 MHz, so while I have 216.287 on the display, I press LIMIT, I get an ERROR, and then I press 406 followed by LIMIT (again), no press SEARCH. The radio should now be searching 216-406 MHz in 12 KHz steps. This is the Military band, and the 220 MHz ham band. The 6 meter ham band is also accessable via this trick. Please note that the the mode always stays FM. This trick also works for freqs as low as 26 MHz and as high as 546 MHz (these are my records), but I have also noticed that the Air Band (118-136) does NOT work with this trick. If anyone else out there with such a scanner and try and confirm this, it would be apriciated. This trick will probably not work with never scanners that have internal battery back-up which you cannot disconnect. If anyone has any comments, questions, ideas, or if anyone wants to let me know which scanner it worked on, feel free to e-mail me. Thanks.

>RV.
>
>Thanks, Bill W2BLC

I have the "old" 706, and if I recall correctly, the improvements include:

Easier "bandswitch" operation. There are two small buttons on in the upper and lower right corner of the radio that switch memory channels on the old unit, and change bands on the MKII.

20 watts on 2 meters on the MKII, 10 watts on the old 706.

2 switchable filters on the MKII, just one on the old 706. Typical filters are available, like 250 and 500 Hz CW, 1.8 kHz narrow SSB. Included "permanaent" filters are SSB, AM, FM, and "wide" FM - wide enough for broadcast band FM.

Better VHF sensitivity outside the 2 meter band. The old 706 filters rolled sensitivity off above 120 MHz (but a separate filter provided good sensitity in the 2 meter band, and mods are available to leave this filter in place across the rest of the band, with poorer intermod proformance.

RIT frequency readout (I believe). The old 706 gave no indication of how far the RIT was taking you from the dial frequency, although one button-push would bring the transmitter and dial up to the "RIT" offset.

This is all from memory when the new unit came out, so I might have missed a detail or two. Anyway, I didn't find myself too unhappy at having the "old" unit. The updates weren't enough to make me want to trade.

73,
Gary KN4AQ

1717. FT901 tuneup

PLL-0 (zero) is causing the problem. If looking at the PLL unit with the
front of the radio to you it is the one closest to the front and near
the middle of the radio. Remove the PLL unit, resolder all the
connections under the VCO (inside the enclosure) and reset it for 8v at
the test point (bare resistor lead sticking up).

Body handling: HTML body converted to readable text

I don't know if there is an interest in this stuff but I have the
following items for trade:

1 Army TA-312 telephone with all technical manuals for operation and
repair (works good and cosmetics good))

All TM's are in excellent to good condition and are as follows:

TM 11-5820-398-12 PRC-25 Operators Manual -November 1965 .
TM 11-5820-398-20P PRC-25 Repair Parts TM -November 1988
TM 11-5820-497-34P PRC-25 Direct and General Support Parts and
Repair Tools List - April 1979

TM 11-5820-667-35 PRC-77 Direct, General, ,Depot Maintenance
Manual - February 1968
TM 11-5820-667-12 PRC-77 Operators Manual - January 1987 (3
each)

TM 11-5830-256-13 LS-147F/FI Intercom station Operator
throuugh Depot Maintenance Manual - November 1986

TM 11-5805-262-12 SB-22 Telephone Switchboard Operators Manual
- June 1990

TM 11-5985-357-13 OE-254 Antenna Group Operators Manual - Feb
1991

TM 11-5965-280-15 H-189/GR Handset Operator, Parts, and
Repair Manual- October 1966

TM 11-5820-461-12 AN/GRC-50(V)1 - (V) 5 and AN/GRC50A Radio
Sets Operators Manual - Oct66 (2each)

TM 11-5820-540-12 AN/GRC 103(V)1-(V)4 Radio Set Operators
Manual - July 1988 (4each)
TM 11-5820-540-20P AN/GRC 103(V)1-(V)4 Radio Set Repair Parts
and Special Tools List- March 89

TM-11-6625-2658-14 AN/USM-281C Oscilloscope Operators-General
Support Mantenance Manual-May 80

If you have something to trade in the electronics or communications
realm give me a holler. (older shortwaves, scanners, transistor radios
etc...) But if not, I'm open to almost anything. Would really like to
trade but if you don't have anything you don't need anymore, will sell
manuals also.

Thanks,

Monty

1726. *** THe NeWs: ICOM IC-T2A HT ***

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-26 00:00:00 UTC
From: webmaster@radiotelephone.net.ham
Message-ID: <345396f1.77014@news.total.net>
Source record: 163242
Cross-posted to: rec.radio.amateur,rec.radio.amateur.misc,rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

Welcome to "THe NeWs," the news for the hams and the scanner listeners.

This Week's Topic:

ICOM's IC-T2A/T2E

- I purchased a brand new IC-T2A at $219 CAN + TAX = ~ $250 CAN.

- 2m HT txvr

- transmits 140-150. no mod needed.

- receives 137-174, including WX weather channels (in memory).

- 8 AA batteries fit with this HT (no battery pack...)... comes with 8 AA batteries and charger.

- 1W low, 4.5W high power output

- 40 memory channels

- auto repeater offset

- DTMF transmit

- CTCSS transmit/receive

Conclusion: It is cheap. It's a good radio.

This information is for US version. For other versions, please consult your local ham stores. This is for your information only and I am not responsible for unsatisfaction for the product or any illegal actions arising from this "THe NeWs." (ie. transmit outside band).

As far as outside TX capability is concerned, I strongly recommend this radio for outside band users. No modification is needed to transmit outside TX. Open a box, it's ready. (Warning: Transmitting outside band is illegal if you are not authorized.)

Next week's topic: IC-706 & IC-706 MK II, HF + 6m + 2m mobile radio

Two weeks later: ADI's Territory - AT-600 Dual Band HT

1727. FS Diamond DJ-130 Discone

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-26 00:00:00 UTC
From: Phil Johnston <johnston@christcom.net>
Message-ID: <3453A2A8.72A4@christcom.net>
Source record: 163243
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.swap,rec.radio.scanner

If you are looking to obtain a mint (almost new) Diamond DJ-130 Discone antenna, here's your chance. The antenna was recently purchased new from an antenna company, installed this past week, and was taken down after about 36 hours of continuous installation time.

It was removed because it picked up a carrier -- from who knows where -- on a VHF AM aircraft channel. Efforts to track down the carrier failed. This has been a frustrating experience. Because the antenna was connected to a scanner which is used to monitor selected channels, the presence of the previously undetected carrier presented a problem. The carrier was present on 133.475 Mhz AM. Nothing appears to be wrong with the antenna, but the carrier on this frequency is unacceptable because it produces a "beat note" with the monitored radio activities on that channel ... not to mention that it stopped the scanning most of the time.

Although the antenna was purchased for amateur use, it is rated at 200W for amateur bands between 25 and 1300 Mhz.

The antenna has been returned to the factory packaging. It will be shipped U.S. Postal Service Priority Mail in a large antenna mailing tube (same one used by the antenna company who shipped it to us).

Price: $75 (includes pre-paid shipping). Payment by Cashier's Check or MO.

All replies will be answered.

Thank you.

I have an RF-1, and it packs a lot of features into a very small box. However, there's one point about the advertised features of the RF-1 that can be misleading. The RF-1 does *not* read R + jX. It doesn't even tell you whether the load is inductive or capacitive. When you select the "L" or "C" reading, it measures the absolute value of the impedance, and displays the value of inductance or capacitance that would have that impedance at the measurement frequency. The L and C readings are only accurate for nearly pure inductors or capacitors. The RF-1 will measure Z from zero ohms to above 2000 ohms, and SWR from 1:1 to 15:1.

The manual that comes with the RF-1 suggests a procedure for calculating R + jX from the readings you get. Basically, you tune to the nearest resonance (minimum SWR) and read Z at that frequency. That reading corresponds to R. Then go back to the frequency of interest and read Z. You can calculate X by taking SQRT(Z^2 - R^2). If the frequency of interest is above the nearest resonant frequency, then X is positive, otherwise it's negative. This approach works fairly well for determining the reactance of a simple antenna like a dipole, because the resistive term doesn't change very rapidly with frequency, and you know what sign the reactance will have as you tune off resonance. I don't know if the same trick will work on multi-element antennas that have complex equivalent circuits, but it might still be a fairly good procedure close to resonance.

Hi. I have a FT 50RD for sale. It is brand new. I got it last Wednesday,
and dont like some of the features. It has a voice recorder, 5W Battery.
There is nothing wrong with the radio. $325 and we split the shipping
and COD charges.

Gentlemen,
I have a question for someone who may know why I observe the following when I load up this amplifier on 160m. No matter how I load/tune this amp on 160, the grid current meter deflects negative (below zero). The amp is easy to drive and seems to have no problem with arcing, etc. Plate current acts normal. Is this phenonenon a metering problem? This makes no sense to me. Ten Tec service did not really have an answer for me. Any ideas would be appreciated.

Thanks,

George

What happens to the sensitivity of an already poor scanner when you
"trick" the PLL system into freqencies that the front end wasn't
designed for???? have you actually HEARD anything REAL on the "tricked"
freqs?????

One idea may be to change the 11.3258 mhz xtal used to produce
the 34 mhz mixer fo. In the 142gtl the same xtal is 11.1125 mhz
and the divider input codes are shifted. If you would compare the
N codes and the mixer frequencies you may be able to figure out
what the frequency of the new xtal should be.

1755. Kenwood TM-V7A Mods? (No, it's not what you think!)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-27 00:00:00 UTC
From: CJ <cj@boi.hp.com>
Message-ID: <3454CBAE.41B4@boi.hp.com>
Source record: 163073

Well, I finally went out and bought a TM-V7A. So far, I really like it!
There is one mod, however, that I'd really like to do. I noticed in the
manual that they say the European version (TM-V7E) comes with a Type N
connector for the antenna instead of the SO-239.

Being a big fan of Type N conectors (most everything I have is 'N' or
SMA), I'd really like to modify my V7A to have the 'N' connector. I
called Kenwood's service number and got some guy who said that they
can't get any of the european parts here in the USA. He also told me
a few other things which I later figured out from the manual were wrong,
so I'm not sure I beleive him. Maybe he's new.

Anyway, if anyone knows where I can get the 'N' connector, or what part
number to order from Kenwood, or wherever, or how I can really get to
talk to a technical person at Kenwood, please let me know.

From: "Victor D. Mete" <ke4qjk@worldnet.att.net>
Message-ID: <630mqm$8cv@bgtnsc02.worldnet.att.net>
Source record: 163120

Bill,

I had hands on experience with an FT-840 (which I own) and a IC-706 this past Field Day. We had a number of rigs there in fact; a FT-747 and FT-990 as well. The Yaesus performed WELL! The guys were VERY impressed with the performance of the 747, 840 and 990. They were not at all impressed with the IC-706!

Months later, after considerable thought and conversation with owners of the IC-706MKII, I decided to buy a MKII. In short, GREAT RADIO! Significant improvements over the first release 706! They sound better on transmit and hear better on receive that the first release.

After hours of comparisons of the FT-840 and the IC-706MKII, I'd say it's real close with SSB reception ... thought personally I think the 706MKII has the edge. AM reception (which I like to listen to AM broadcast a lot) is better than the 840 (should be for the $550 more). I mention the 840 because I have it here and have tested side by side. Most HF guys familiar with the 840 will speak well of it!

I didn't buy the first release 706 because of sooooo many bad reports. I have not heard one bad report regarding the 706MKII!

Hope that helps.

Bill Clarke <BillClarke@mindspring.com> wrote in article <3453B074.C21ADEEA@mindspring.com>...
: 95 percent of my operations are on 75 meters SSB or 2 meters FM (thru
: repeaters or local simplex). What will I gain by buying a 706 MkII over
: a used plain 706? Rig will be used in shack sometimes, but mostly for
: RV.
:
: Thanks, Bill W2BLC

> zs6awk@global.co.za

The meter circuit depends upon a regulated voltage (via a zenier diode)
which is derived from the motor control voltage. If the voltage drops
too low, the meter source may become unregulated. Also, the return
circuit for the meter is via the common wire (and the case of the rotor)
so be sure all these connections are good.

Also, the meter pot in the rotor is famous for becoming worn and
intermittant in some spots. Perhaps the pot needs cleaning or
replacement. Also be sure that the rotor arm on the pot is making good
connection to the top cover of the rotor as this is where it gets it's
common return connection. Pots tend to ware in spots where you leave the
rotor parked. Wind causes a slight movement of the rotor over the same
spot.

Yes, there is Kenwood, Icom, Alinco, and over 100
other mailing lists at QTH.Net.

If the one you want is not there, we can start it
tomorrow ;)

Please refer to: http://www.qth.net

Also, I have modifications and information for many,
many radios on my home page at:
http://www.qsl.net/k7on/mods/radmods.htm

For those who like the older rigs:
http://www.qsl.net/k7on/boats/boatanch.htm

There is a DX page that needs added material:
http://www.qsl.net/k7on/dx/dx.htm

There is over 500Mb of shareware available:
http://www.qsl.net/k7on/shareware

And much more: http://www.qsl.net/k7on

And you can sign up for a free email account with
FTP and WWW space at: http://www.qsl.net

Or, start your own free club/organization mailing
list (reflector) by mailing me: k7on@qsl.net

1772. FT-50R question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-27 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <877960196.13937@dejanews.com>
Source record: 163134

Hello FT-50R owners,

I purchased an FT-50R from HRO in Woodbridge last weekend. Great little radio! I do have one question, though -- have any of you noticed that sometimes, when you turn the knob to change frequencies/memories, sometimes the frequency/memory will initially sequence in the OPPOSITE direction from the direction you're turning the knob (and then start going the proper direction after the first click or two), and sometimes it'll "miss" a click and take two clicks to change from one channel to the next?

I don't regard this as a major problem, because it's been a pretty normal occurrence on most HTs and some mobile rigs I've had. I guess the "click stops" just don't match up exactly with the encoder. I just thought I'd ask if anyone else has noticed it happen on their FT-50R.

Thanks!

1773. FORSALE - Immaculate Kenwood TS-520, great starter rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-27 00:00:00 UTC
From: jpl@qc10.ho.lucent.com
Message-ID: <6328h3$nu@nntpb.cb.lucent.com>
Source record: 163135
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,nj.forsale

I have a virtually immaculate Kenwoods TS-520 rig that I would like to sell.
This was my first "real radio and in my opintion is still
one of the best rigs around. It would make a fantastic beginner
station or a great backup rig.

I am only the second owner of the rig.
I purchased it from a collegue of mine at Bell Labs (who
was the original owner), and I have the orignal sales receipt,
boxes, and manual for it. Both he and I took
exceptionally good care of this rig. It has NEVER been in a smoking
environment and has NEVER been mobiled.

For any novices not familiar with this radio, it is all solid state
(discrete components, so its very easy to repair if ever needed)
except for a tube driver and a pair of very
robust 6146 tubes as the finals. It has a builit in power supply,
but can also run off of 12VDC.
It covers 80,40,20,15, and 10 meters in CW and SSB (upper and lower) modes.
The receiver section is excellent and I always get excellent audio quality
reports. Many folks say that these older Kenwoods are some of the best
sounding rigs on the air.

This rig also has the optional 500Hz CW filter
installed (genuine Kenwood option).

The price is $300 firm + shipping. You might find one for a few $ less,
but NOT is this great condition.

I bought an FT50R when they first came out and experienced rotary encoder
skip occasionally. I had the radio for a year and a half and this never
presented any problem.

I'm parting out a Hallicrafters S-38B receiver. Need any parts
for your restoration? The guts of the entire set are available,
EXCEPT FOR THE PARTS LISTED BELOW (which are either already gone,
or are not any good):
- Knobs (already gone)
- Cabinet (already gone)
- Bandswitch (rear wafer FRIED, front wafer appears okay)
- Slide switches (no good)
- Tubes (already gone)
- Line Cord (missing)
- Speaker (already gone)

Other than those few items, everything is available. The dial
scale and pointers are good. The dial window is a bit worn but
you should be able to polish it with plastic polish and use it.
The "cardboard" rear panel and bottom panel are in fairly good
condition (a lot of wear, but perfectly usable, especialy if
your set is missing them altogether). Let me know if you need
anything and we'll make a deal.

I bought one. Works Great, has enough features to be useful, MUCH
more solid performance (intermod-wise) than the wideband scanners they
sell nowdays.

Good Rig, especially for the money! The only problem I found was a
design flaw.... a resistor value needs to be changed internally in
order for the external speaker mic to have the same level as the
internal mic. (The 2-meter HTX-202 has the same design flaw).

1793. FS: Alinco DJ-F1T 2meter radio.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-27 00:00:00 UTC
From: "Jack T.Dragon" <tdragonNOSPAM@blarg.net>
Message-ID: <632ugh$o2c$1@guysmiley.blarg.net>
Source record: 163155

Alinco DJ-F1T, used only a couple of
times, still has origional box and looks
brand new.

40 memory channels, CTCSS encode, decode,
and scan (easily find out what CTCSS tone
is being used by another), page others
and send messages, DTMF encoding and decoding
with full 0-9,*,#,A-D keypad, is capable of
xmitting up to 5 watts, outer case is
4.3 x 2.1 x 1.5" with battery pack.

tx 144.0 to 147.995mhz,
rx 138.0 to 173.995mhz, and
rx 118 to 136mhz AM after "clip
the wire" out of band modification.

Comes comlete with battery pack, antenna,
instruction manual, service manual (normally
ordered extra), belt clip, and will come in
it's origional box.

Heck, this thing is as close to mint as
you can get.

Asking $250, OBO.

Also willing to do a flat out trade for an
Alinco DX-70 series radio.

please remove the "NOSPAM" from my
address to respond,
Jack Shannon

From: Ted Minchin <tedm@xtra.co.nz>
Message-ID: <3453E1D6.A61@xtra.co.nz>
Source record: 163157

Hi and thanks for reading this.....

I have an Icom ICR/71E Receiver which is going very well BUT

its RAM battery is getting old and will need replacing soon. I beleive
that there is a modified RAM setup that was available a few years
ago from the USA which used an EEPROM and normal alkaline cells for
back up. Also gave xtra memory channels (I think) . A similar setup to
the IC 751.

Anyone any idea if this is still available and from where and howmuch???
many thanks in advance.

Please reply to : tedm@xtra.co.nz

cheers de Ted Minchin ZL1MT

1796. 486/586 MBs for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-27 00:00:00 UTC
From: Larry Menzel <lmenzel@millcomm.com>
Message-ID: <34550913.75FF@millcomm.com>
Source record: 163158

I have a quantity of brand new in the box 586/486 mb's for sale. They have never been used. Quality board, handles all 486/586 chips (Cyrix up to 120mhz, AMD to K5, and Intel to DX4-100).

These are great in your shack for packetcluster and general computing needs if you're running into IRQ conflicts and/or multiple COM port assignment problems often associated with Pentium systems.

Price: $59 (including CONUS shipping) if you pay with credit card or cash. COD, you pay shipping.

Drop me a line: lmenzel@millcomm.com or call (612)861-4565 and ask for Bruce.

The problem you describe will also appear with a different antenna.
Welcome to the wonderful world of intermodulation. Try this when you erect
another antenna and you experience the same problem. Disconnect the ant
from the receiver. Install a "T" connector at this point. Connect another
cable from the "T" to your receiver such that the path from antenna to
receiver is completed through the "top" of the "T". Now, to the "vertical"
part of the "T" connector attach a piece of coax cable that is 1/4
wavelength at the offending frequency, in this case 133.475MHz. and finally
short the free end of this small piece of coax. This will make a trap that
will greatly attenuate the offending signal.

Receiver---------[XXXXX]----------Antenna
X
X
I
I
1/4 wavelength shorted stub
Also look in CQ VHF a couple of months ago. They had plans for a helical
notch filter that looked easy enough to build. As for the stub, cut it long
and then prune it down in VERY small increments to tune it exactly to the
offending frequency. I'm sure others will also give input as to formulas,
taking into account velocity factor of the coax, etc. Hope this helps, and
remember, it is not the antenna. The external antenna is making a problem
you already had more noticable.

> 73 Chris KC2BZH

Thanks for the suggestions, Chris. However, there's a problem: 133.475
is a desired frequency. Why would I want to eliminate it? The carrier
was on the same frequency. This wasn't an intermod situation as far as
I could tell. The carrier was probably being radiated by something
inside a nearby structure. I never could track it down.

I realize better antennas can pick up signals which previously weren't
received. I just wish in this instance that it wasn't on a channel that
I wanted to monitor.

The Diamond DJ-130 is a great antenna, but I wasn't able to overcome the
carrier. If you are looking for a rugged discone, the DJ-130 ought to
do the job quite nicely.

Again, thanks for your help.

Matches IC-735, but works with most any ICOM hf rig (with proper cable)
Cable supplied for IC-735.

Multi-coax outputs; 1 random wire out
Pre-sets for each band make auto-tuning very quick and precise

Powered by the radio; small and lightweight

Very good condition, works perfectly. Packed in original carton, complete
with instruction manual and all cables.

$250, including shipping and insurance ($529 in recent HRO catalogue)

Lafayette made a mobile HF amp back in the 70's that did 10 through 80M, 5W in, 100W out. I have one, an HA-250, I believe, with a built-in meter, band selection, etc. If you're interested, it's a fixer-upper (needs transistors) and you'll probably want to hunt down the manual / schematics - I lost mine years ago. Worked great, though, and could again, with just a little work. $75 and it's yours.

Nope, works great. I used mine with high-capcity nicads on a
mountaineering expedition because solar charging them was easier. FWIW I
also used lithium AAs and had no problem. Didn't try alkalines though,
not practical because of poor cold performance and heavy weight.

CHINA HAM NEWS 10/28/97
BY1QH Special

Contributed by Lars Melin, SM0KAK
Member, Tsinghua University Amateur Radio Club, Beijing, China

Edited by Rick Niu, BD1QL
MBA '99, Columbia Business School, New York, NY
xn6@columbia.edu

* VHF DX

BY1QH is presently looking for stations who want to try 144 MHz DX, and are located less than 2,000 km away from Beijing in such DXCCs as BY, BV, VS, HL, JT, UA, and, in particular, VK6 (less than 400km from Dampier). The Dampier area is the only location to which it would be possible to make QSOs on 144 MHz using Trans-Equatorial Propagation. Stations interested in working with BY1QH on 144 MHz need to have at least one Yagi (preferably horizontally or circularly polarized), the capability to work on SSB or CW, a good take-off (low horizon) in the direction of Beijing, and a minimum output power of 50 watts.

* EME Report

In the first leg of the ARRL EME Contest, BY1QH worked SM5FRH, SM5BSZ and SM2CEW. The QSO with SM5FRH was the first EME QSO ever from China! BY1QH also heard and identified 11 more stations during the contest. Last weekend, BY1QH worked KB8RQ (first BY to North America on EME!) and W5UN. Also heard was VE7BQH.

BY1QH will participate in the second leg of the ARRL EME Contest on November 15-16. Antenna improvement is becoming urgent as it is not yet wind-proof now. In addition, the club is requesting China Radio Sports Association (CRSA) to clear the much QRMed 144.000 MHz caused by local paging system.

* Contact BY1QH

Tsinghua University Amateur Radio Club is seeking any possible assistance from the international amateur radio community, such as on EME. Please feel free to write to: David Zhang, BZ1BM (bzibm@wg.chnmail.com) or Lars Melin, SM0KAK (lars.melin@era.ericsson.se).

CHINA HAM NEWS is available for unlimited, appropriate distribution.

too expensive for used one.

I bought a brand new ICOM T2A @ $ 219 CAN ($ 160 US).

- outside TX (140-150) (no mod needed)
- 137-174 RX
- 8 AA batteries fit with the radio (comes with 8 AA nicad +
charger)
- DTMF
- CTCSS
- 40 channels
- 4.5 watts
- 3 x 5 x 2

---

the rigs are getting very cheap now... we can get a new HT for a
hundred. we can get a HF for a thousand.

I believe the problem is related to the VCO steering voltage
adjustment range. If any one has the manual for the 508 or 528 please
share with us the location of the tuning cap for the VCO.

Alinco DJ-F1T, used only a couple of
times, still has origional box and looks
brand new.

40 memory channels, CTCSS encode, decode,
and scan (easily find out what CTCSS tone
is being used by another), page others
and send messages, DTMF encoding and decoding
with full 0-9,*,#,A-D keypad, is capable of
xmitting up to 5 watts, outer case is
4.3 x 2.1 x 1.5" with battery pack.

tx 144.0 to 147.995mhz,
rx 138.0 to 173.995mhz, and
rx 118 to 136mhz AM after "clip
the wire" out of band modification.

Comes comlete with battery pack, antenna,
instruction manual, service manual (normally
ordered extra), belt clip, and will come in
it's origional box.

Heck, this thing is as close to mint as
you can get.

Asking $180, OBO.

1842. Re: HTX-404 Broken Display Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-28 00:00:00 UTC
From: aswNS@hamp.hampshire.edu
Message-ID: <3455f6c9.0@192.33.12.30>
Source record: 163097

On Sat, 25 Oct 1997 16:22:23 -0700 Kevin Short (kevin@larson.com)
wrote in rec.radio.amateur.equipment:

: I have an HTX-404 that has suddenly developed what looks like
: an ink splatter in the LCD display. I have a warranty so I am not
: to worried about it. My question is what happened? My thoughts
: are that it could have been impact, static discharge, or possibly
: spontaneous return to randomness [the LCD display just failed].

Did you leave it in your car overnight? Low temperatures can damage
an LCD display that way. It is generally irreversible, although some
of the smaller spots may disappear when you get the rig back into a
warm environment. It doesn't seem to affect the operation of the
screen, except, of course, the black areas stay black and whatever
might be displayed there is lost forever.

I have seen several pieces of equipment damaged this way. I was
surprised the first time it happened to me, and I have never seen a
warning about it in any instruction manual. The Care and Maintenance
section of the HTX-404 says only to "use and store the HTX-404 in
normal temperature environments" and the Specifications say the
operating temperature range is 14F (-10C) to 140F. I don't know at what
temperature the LCD screen can be damaged, but I am sure it is not far
below 14F, if that low -- as I said, normal winter temperatures here
in Massachusetts can do it.

I don't want to single out Radio Shack for not mentioning this in their
manuals. I have an old Kenwood HT that was severely damaged this way
before I obtained it, and the Kenwood manual doesn't mention the risk
of damage to the display by low temperatures. The Kenwood TR2400
manual claims an operating temperature range to -20C -- that is well
below 0F, and I am sure that is low enough to damage the LCD. The
manual for my current best mobile rig, a Yaesu FT-212, also
says operating temperature range goes down to -20C. I am being very
careful about not leaving this rig in a cold vehicle, I presume the
LCD screen technology it uses is the same as Radio Shack and the old
Kenwood.

1843. Help with TS-940 Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-28 00:00:00 UTC
From: km1h@juno.COM
Message-ID: <19971028.090413.9687.8.km1h@juno.com>
Source record: 163098

I have a 8 Million series that is driving me nuts on 160M only. All other bands are fine.

At full power the TX goes into oscillation and the PA current jumps to 15A.
I have swapped out PA , RF, AVR and Control board assemblies with no change.

When this happens the RX-TX relay on the RF board is chattering and the pulse can be viewed on the scope.
I have another 940 to steal boards from but looking for ideas before I go into wholesale shotgunning.
Tnx Carl KM1H

1844. NEED INFO: Drake SC-2 (2m converter)

Drake mavens, please help identify this item...

I just bought a Drake SC-2, which I'm told is a 2m receiving convertor that works with some Drake HF receiver. I've never heard of this unit before. I've asked around with the locals, and none of them have ever heard of it either. I haven't seen it yet (bought it off the internet sight-unseen) so I can't even visually describe it. It will not come with a manual or schematic, so I'll be needing those too. Can anyone help me out with this? Will it work with my 2-B receiver?

1847. MAHA HT Docking Station

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-28 00:00:00 UTC
From: fkelcz@facstaff.wisc.edu
Message-ID: <fkelcz.280.00612193@facstaff.wisc.edu>
Source record: 163102

I don't really want to commit to a mobile 2m/440 and was wondering if anyone has anything good or bad to say about the MAHA HT dual band HT Docking Station (MH- A302). The concept seems good, take off your battery and slide the HT into the dockingstation - and have instant mobile...get to your destination and take your HT out again.

Thanks,

Fred K, N9SLR

1848. Heath Transistor Equivalent Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-28 00:00:00 UTC
From: jdegood@sarnoff.com
Message-ID: <63517h$4l24@postoffice.sarnoff.com>
Source record: 163103
Cross-posted to: rec.radio.amateur.equipment,sci.electronics.repair

I need a substitute transistor for Heath part 417-912, the PA driver stage (Q301) in a Heath VF-7401 2m transceiver. The failed part is marked only with the Heath part#.

The Heath manual lists the substitute is an mrf245, but this has to be a typo as mrf245 is a Motorola RF output transistor in a high-power package.

Any pointers to an equivalent part would be appreciated.

Thanks,

John DeGood
jdegood@sarnoff.com

1849. Test Drake L4B

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-28 00:00:00 UTC

I may purchase a Drake L4B Amplifier. What OUTPUT power would
you test for under a given Exciter input power, Line voltage and band?
By the way If you know of a good amp for sale in the NY City vicinity
please let me know.

Len

1851. Kenwood's Circuit Diagrams

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-28 00:00:00 UTC
From: l38217@alfa.ist.utl.pt
Message-ID: <6353hs$8nj$1@ci.ist.utl.pt>
Source record: 163106

Hello !
Can anyone tell where can I get or order Kenwood's circuit
diagrams for the models since the 140, 440, 940, till now !
I'm only interested in HF models.
The technical manuals would also be apreciated.
If there is anyone who knows how to get this, please email !

Thanks, best 73 !

I think the price is around about 20-bucks now......$$$$$
If your Pro2006 is an early one with the DIM function only,
you can modify it to turn off like the later ones with the LIGHT
button. Just remove surface-mt resistor R-505, 47ohm.
You need to remove the shield from the logic board to get at it.
It will then only light when you push the button in, the
DIM position just like the Later model.

1860. FS:PRO-26 SCANNER Perfect Condition w/ accessories...

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-29 00:00:00 UTC
From: "David M. Ritzenthaler" <ritz@gocougs.wsu.edu>
Message-ID: <34581133.643F@gocougs.wsu.edu>
Source record: 162967
Cross-posted to: rec.radio.scanner,rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.swap

PRO-26 "hyperscan" scanner for sale!

For a detailed feature list see the following URL
http://support.tandy.com/support_electronics/doc17/17719.htm
For a GREAT picture go here
http://www.demon.co.uk/javiation/pro26.html

Great scanner in PERFECT condition. No scratches, no scuffs, no marks. No ink worn off the buttons, no logo's worn off the case. Comes with charger (not included at time of purchase) and 4 AA rechargeable batteries (these were not included at time of purchase) and a rubber duck antenna. Has a clip to go on your belt.
Scans 25MHZ to 1.3Gig ALMOST SOLID! It is missing the cell phone freq.'s but I can tell you how to modify it so they can be received. I have 5 pictures and specific instructions on how to do the mod.

It's called a "hyperscan" because when you hit the hyperscan button you can scan through a band... say 155 to 160 MHz at 10Khz steps in about 5 seconds... WOW, you don't miss anything.

Also when you do this kind of a scan, sometimes there are channels that have "garbage" that always catch your squelch, and stop you dead, well you can just hit a button and to "skip" up to 50 of these. Very handy when your scanning a range and there is garbage right in the middle. You can find more stuff faster this way.

up to 200 memory channels in 10 banks... so you can choose to scan 20 channels with the touch of a button. Great when you drive through different areas, and you need to switch over quickly to a different set of freq.'s.

keylock button, so you can stick it in your pocket and not change any settings.

The cool thing about this scanner is you can choose the "mode". Like AM, FM, WFM (wide band FM for listening to radio stations, and even some public service stuff).

It has a attenuation setting that can be set for individual channels, so you don't have to crank you squelch up just because one channel has a little noise. Just hit shift-attenuate on that channel, and the others don't have to suffer.

IT AUTO-PROGRAMS!!!! You give it a bank to work in, and give it a range to scan, and when you come back.... It has recorded all frequencies that have made any noise since you left. This is especially handy with a VOX

(voice activated) small hand held recorder (which i will include for another $40 dollars with charger and a few micro-tapes).

I will include TONS OF PAGES of secret freq.'s that I have discovered (FBI, CIA, ATF... etc).

This is a scanner for "the big dogs". Nothing wimpy about it.

I bought it new for 450 + tax + charger + batteries.
Will sell for $375.00 shipped UPS ground at my expense ($40 bucks more with the micro-VOX recorder, charger and tapes, i'll even throw in the batteries)
INCLUDES MANUAL!!!!!!
INCLUDES DOCUMENTATION FOR THE MOD
Or just look here =>http://w5gb.nmsu.edu/kc5kto/mods/pro26cell.html

1861. WARNING: RadioShack HTX-242 2m rig's Memory Retention Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-29 00:00:00 UTC
From: mbryan@intranet.ca
Message-ID: <mbryan-2910972129130001@ppp49.intranet.ca>
Source record: 162968

I believe I have identified a design and/or fabrication flaw in the Radio Shack HTX-242 2m, 45-watt PLL synthesized 2m FM rig. I bought one a year ago and it developed, just a day or two out of warranty, the annoying habit of spontaneously re-initializing itself when turned on, thereby returning all 40 memories and many other settings to their factory default settings and losing all memory contents.

I purchased a second HTX-242 while the first was being readied for repair because I like the rig's operating features. wanted a second for the second family car. Guess what? It has the same defect brand new right out of the box. About every 10th time the radio is started up, the memory dumps and I have to spend another hour reprogramming all 40 memories and many other user programmable features and options.

I'm taking both radios back to Radio Shack to demand either my money back on both - - - or that both be properly fixed. Can anyone shed any light on this defect?
My local RS repair depot has no knowledge (yet) of any recall or service bulletin on this radio because of a memory retention fault. The supply voltage in my car dips memontarily to 5 volts for half a second or so during engine cranking/startup, but this is supposed to be non volatile memory. And anyway, how come the radio is fine 9 times out of ten during engine cranking?

If anyone has had a simil;ar problem with the HTX-242 I'd appreciate aNY NOTES YOU COULD SEND ME on how you resolved it...or what caused the rig to re-set.

thanks - MIKE - VE3 CGT

Still looking for the brass tuning slug for a Hallicrafters SX-101A receiver. Would appreciate anyone who might have one, or knows someone who has one. Would even consider taking a complete junker if necessary. Please check your junk boxes or old equipment in the basement/attic. Thanks...
73, Mike

Yea, and about that time the N9ICU repeater group will start with 15 KW
ERP ATV repeater on this band. Guess what the FCC will do when
consumers complain their cordless phones don't work..... It IS in the
plans!

>talk to a technical person at Kenwood, please let me know.

What's there now? Is it a SO-239? If so, you might find that a decent
quality (e.g. Amphenol) N connector will mount using the same screws
as the SO-239, and will project just about the same amount into the case
so it can be soldered to whatever the SO-239 used to be connected to.

The two connectors are remarkably alike from the rear. I upgraded a
MFJ dummy load from SO-239 to N in exactly this way.

>>
Yes, the cell phones are full duplex, but... you can generally pick up
both sides of the conversation by monitoring the base station (867-895
Mhz or so). The base is higher power and easier to hear than the remote
(which is somewhere in the 822-850 area). What you hear is the (landline
phone user) speaking quite clearly and the remote user a little fainter.
What's happening is the microphone in the landline user's phone is
actually picking up what the remote is saying via physical conduction in
the handset. This is then broadcast out from the base. Didn't realize
those mic's were that sensative!

Hello: Vectronics is no longer located in Canada. The owner defected to the
USA a few years ago. You can find information on the Vectronics company
at
http://www.vectronics.com

The guy who was the engineer/owner for Vectronics has sold the company
and has re-opened a company called PALSTAR. His name is Paul Hrivnak.
He can be contacted at Palstar@erinet.com

This was addressed recently, if you are running the highest power into the short duckie antenna you are probably getting RF cycled back into the radio. Try a longer antenna, or external antenna.

I'm sure the fellow who replied in detail before will do so again. DavidC

National NC173 for sale. Complete, operating condition. Inside extremely clean, appear to be all original tubes. Exterior a few scratches on the top and a little fading on the knobs. Tuning feels good, scales a little yellowed but complete. No speaker. $125

Hallicrafters S38 complete except for bandswitch knob. Clean. $50

Take both and I'll pay the shipping. Units are in southern NH - I would be glad to show them if you're in the area.

Philip Barber

>Yes, but that would be illegal.

Depends on what country you're living. The possibility to transmit
outside the ham-bands is legal in Holland, however it's forbidden to
use the possibility.

My 706MK2 transmits from 150 kHz to 54 MHz, and from about 136 to 200
MHz, everything legal. I didn't do the mod by myself, I asked the
ham-store to enable this option when I bought it.

I live in upstate New York, and use an Alinco DR-130 mobile which
stays in the car all the time. It's been in the car for 3 years now,
and I haven't seen any damage done to the LCD screen. There's nothing
in the manual about it. Perhaps different makes and models react to
the cold in different ways?

Icom 736 (HF + 6M) for sale. Excellent (like new)
condition. Probably less than 100 hours operation.
In-shack unit throughout.

Features:

General Coverage rx
All HF bands + 6-meters - CW, SSB, FM @ 100 W tx
AM @ 40 W tx

Full break-in (QSK)
Speech compressor
Passband tuning
Notch filter
Noise blanker

Dual VFOs, split operation
RIT & XIT
Double band-stacking memories
Direct frequency entry
100 memory channels, etc.

Built-in AC supply
Built-in automatic antenna tuner
Dual antenna switch

Includes:
----
* original manuals
* both optional IF CW crystal filters (500 Hz)
* optional service manual

Will sell as complete package for $1500 plus shipping.
Will include original packaging/box if I still have it
(haven't looked yet, but I'm pretty sure I saved it).

1894. 9600 baud GMSK receivers IF chains .....

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-29 00:00:00 UTC
From: daniel@pandora.lugs.org.sg
Message-ID: <6383tk$26d$1@columbine.singnet.com.sg>
Source record: 163057
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.scanner

Hi,

I have been experimenting with receiving 9600 baud
GMSK modulated signals on 2 of my radios. The signal strengths
are very strong on both, but on one, an ICOM R-7100, I am seeing
many errors in the received bit-stream, while on the other,
a Kenwood TM-251A, a 9600 baud ready radio, I get almost 100%
correctly received data.

On the R-7100, I have tapped the signal off what I
assume to be the discriminator (as prescribed by several mods).
The mod seems okay for lower rate data, say 4800 GMSK or FSK.
I have also tried putting some buffers on the discriminator
output plus some filtering to clean it up from residual IF
frequency in it (455kHz). A look on the scope shows good
representation. However, since I do not have a storage scope,
it is hard to be objective in this comparison. Off hand, I
seem to notice that the peaks were a tad sharper on the ICOM
than on the Kenwood.

I am wondering if the problem has to do with some
non-linearity in the discriminator or due to group delays in
the IF filter stages. I am however, very uninformed about all
this stuff and would appreciate any pointers that might help
me understand why the ICOM rig does not do well at receiving
high rate GMSK signals.

Will using a different type of FM detector help? Such
as a PLL type detector for example? The bandwidth of the radio
is about 15kHz and the IF filter preceding the discriminator
is a CFW455E (on the Kenwood it is a CFWM455E). The bandwidth
filter in the ICOM is diode switched. There is also a limiter
after some buffers on this filter output. The FM detector has
a ceramic resonator in it (CFY455S).

I suppose those who have been playing with 9600 baud
TNCs would know a lot more about this and could offer some
advice. Thanks in advance.

Looking forward to any replies.

1895. Motorola Microphone: Need Info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-29 00:00:00 UTC
From: jvm@inmind.com
Message-ID: <3457b0db.20653756@news.inmind.com>
Source record: 163058
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

I have received through the usual ham channels, a brand new Motorola hand microphone. I would like to know its impedance, whether it requires a voltage (e.g. electret), and the wire color code/plug pinout.

Is there a tech support number at Motorola that I could call ?

The mic is Model No. HMN 1056D, and looks like a typical mobile mic, except that it has an 8-pin "RJ-style" connector at the end of the cord.

Thanks in advance for any leads !

73,

Jim Morgan WX4D jvm@inmind.com

Hi Kevin,
Bob is talking about glass tubes like 3/8 to 1/2 inch diameter
that have a low boiling point liquid in them. They are made in
the form of letters in a sign that has a light in the bottom
for illumination and a heat source. The heat boils the liquid
and bubbles rise in the tubes.
If you see any bubbling radio tubes (valves) let me know.

For Sale - Tektronics 2235A 100 MHz Oscilloscope

Dual Trace Oscilloscope (Used only for low voltage measurements -
never experienced high potentials)

100 MHz dual time base

High sensitivity for reliable low-level signal
measurements

5 ns/div sweep speed and 2% vertical and horizontal
accuracy for high resolution voltage and timing
measurements.

Graticule illumination, trigger view, dual time base, HF
and LF reject coupling trigger and delayed sweep
measurements.

In very good condition both cosmetically and functionally. No probes or
manual but otherwise complete. This was my primary piece of test
equipment in my business. Am selling because I changed fields and no
longer need it. Asking $750 plus shipping or best reasonable offer.

Contact: Rob Bellville at rob@acol.com

Source record: 162920
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

My G5RV shows relatively high SWR on all/most bands .. but not infinite.

Loads fine on all bands with my Kenwood TS-570D antenna tuner and seems to "get out" OK.

You might try a longer/shorter piece of coax. Also make sure the ladder line (a weak link) is well-connected to the antenna sides and to the coax-ladderline interface unit.

Phil

P.S. .. seems I recall that Cecil Moore has G5RV info at his web site.

I'm quite certain R/S discontinued the HTX-100 and sold off existing stock some time ago. Still, I'm wondering if there isn't a new unit or two still in R/S inventory somewhere. Can anyone confirm/deny?

I think R/S missed a bet by not working up a 6 m (or, better yet, 6/10 m duo-band) version of this rig in contemplation of the upcoming solar max.

I have used both HTX-202s and HTX-404s - the 440 portable- and feel that
I can judge them rather well. The HTX-202 is an outstanding radio, due to
it's narrow front end, it has an extremely tight front end and is very
intermod
resistent. The 404 on the other hand, I find to be a poor quality radio.
Allow me
to preface the following by saying I do own one and continue to use, at
least
until I put a good dual band mobile in my truck. First of all, the
receiver is not as
sensitive as the receiver in the 202 or in my Kenwood TH-79. It also seems
to be
easily damaged by nearby transmitters. My TH-79 works just fine in the
same
environment that the 404 does not work well in. My 404 has been replaced
once,
and the second radio is just as bad as the first.

In my honest opinion, the only thing that the 404 is good for is
crossbanding thru a
suitable mobile radio.

Hi Fellas;
I have this Collins Military Tuner for SALE:
I believe its a model 180U-2, thats wat I've been told anyway.
The front name plate has been removed but the components on the back are
collins.
It contains a spkr, wattmeter on the left and the tuner section is on the
right. Has all original knobs and in nice shape.
Supposedly its the tuner/wattmeter for the URC-32A XCVR
Price is $250 shipped Conus.
I can supply a .JPEG picture of it if required.
Thanks es 73.....RICH RLUCCH2098@aol.com

I generally find a big old ugly electrolytic capacitor like about
20,000 uFd at 100 volts or higher. I install a 10 amp fast blow fuse
in series with the wire being attached to the caps positive terminal
and then attach the free end to the alternator output post. I ground
the caps negative terminal to the autos chassis. That has most always
removed the alternator whine problem. I use a fuse so if the cap
dries up and shorts it likely will not blow the alternator diodes. In
some tough situations I twist the positive and negative leads together
before attaching to the alternator and ground. This seems to stop
some radiation from the caps leads.

Hi,

After some 10 years in packet radio, I've decided to go to a "lower profile" and sell off most of my packet ports. All radios are in great shape, as they'veonly been used on packet (very low duty cycle). Some have never had a mic pluggedinto them. All prices are firm, and do not include shipping. I stand behind allthis gear 100%. I'm an Extra class licensee, and a professional Electronics technician. I'm also an ARRL/FCC V.E. Examiner; radio amateur for 20yrs. I tell you this, so that you will have an idea as to how these items were cared for during their time with me. (non smoker) Here's the list:

Alinco DR-110T 2mtr transc. (cellular receive capable ...not modified) $150 Yaesu FT-212RH 2mtr transc. (tone encode/decode .. very user friendly) $175 Icom IC-281H 2mtr transc. (440 rcv. .. 9600 baud capable) $175 Icom IC-38A 220 mhz Xcvr. (used exclusively on packet) $225 Kenwd TM-733A 2mt/440 dual band (9600 baud, used on packet only) $300

Kantronics RFC 3-312 220 amp/pre-amp (30in - 120 out ... up to 150w) $225 Cushcraft 220 (1 1/4mtr) BOOMER (15ele - 15.5db gain) $ 75

Kantronics KPC-3 512K! (I personally did the 512K mod!) $120 Kantronics KPC-9612 (dual port 9600/1200 tnc ... 128K) $200

I have the manuals and in most cases, the original boxes, etc.

Bank certified check or Postal M.O. acceptable tender. Estimate shipping costs at $4 to $7 for continental U.S. via UPS Ground.

If you are interested in any of the above, contact me at:

Have four left:
CSI (Connect Systems Inc) Micro Patch, Model 9800D Multi-Mode
Interconnects.
These units were used for a 45 day period in Alaska,1994. They have
been in storage the rest of time. The units look as new, and include the

optional 9801 Electronic Voice Delay. I also have "Users Instruction
Manual" These units are current models, and Ham Radio Outlet sells
the 9800 for: $749.00, and the optional 9801 for: $139.00.
For complete information and specifications, please see:

http://connectsystems.com/cs9800d.htm

I am Selling these for $250.00 ea.
Please contact me via-email jeepham@ix.netcom.com
Thank You, and 73 Darrell N6ZKV

1951. The G5RV, a piece of junk?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-30 00:00:00 UTC
From: morinm@csgoeland.qc.ca
Message-ID: <878260483.17039@dejanews.com>
Source record: 163007
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

I have a MFJ G5RV with the center at 37 feet and the ends at 22 feet. It is fed by a 70 feet length of RG8 coax. When I tried to tune it with an automatic antenna tuner, I couldn't do anything on the 80 meter band where I operate normally. I could only tune it with a manual tuner. I then started to wonder why this was happening. I decided to verify where the antenna could be used without a tuner and what was its exact resonance point. The highest SWR I can measure is 5 so I will call that infinite. Here are the results I got:

Frequency SWR
80 meter infinite everywhere
40 meter infinite everywhere
20 meter infinite everywhere
15 meter infinite everywhere
10 meter infinite everywhere

I got a SWR of 3 at 13.9 mhz, outside the band where it should operate best. The resonant frequency of the G5RV was found at 19.650 mhz where the SWR was 1 to 1.

Could someone please explain these results and tell me if I am right in thinking that my G5RV is a piece of junk? I can't think of calling CQ at 19.650 mhz, no one would answer me.

If my G5RV is really a piece of junk, then explain why I can regularly make contacts at more than 1000 miles on 80 meters SSB? I am really running out of answers. I would like experts like Cecil Moore to explain my problem.

Hello,

My first time in here, so please excuse any jargon gaffes. :-)

I am looking for a 2 way communication system for emergency
use by route drivers.

The system should be able to contact/make telephone
connections.

The system must communicate 100+ miles.

The system should be a dedicated to emergency use by drivers.

The system should be able to contact a pager and leave
an emergency message to 'on call' staff.

==> A high power walkie talkie might be one answer.

I have rejected cell phone usage for it's lack of
security (random calls) and expense.

Can someone point me in the direction I need for this
application?

cc:lon@execpc.com

.... and thank you for your attention.

I have a Yaesu FT-990 for sale for $1295. This radio is in MINT, AS NEW condition. It has less than
15 minutes transmit time on it. It was bought as a backup rig and is guaranteed to be in as new condition.
It is the DC model and includes the original box, microphone, manual, service manual and all original
hardware. I will split the shipping costs via U.P.S.

1959. GOOD NEWS re VX-1 SOFTWARE!!

From: Andrew M Cohn <andy@vais.net>
Message-ID: <345A1430.2DC4@vais.net>
Source record: 162866

FYI: I just called RT Systems to check on the status of the new ADMS software for the Yaesu VX-1. They advised me that Japan has approved the product. RT Systems will begin shipping next week. I went ahead and placed the order today, Thursday, Oct 31, and I was told to expect the software by Friday, Nov 7th. They are charging around $39.95 plus $5.00 for shipping.

I tried to get some info about whether the software allowed us to program frequencies from different bands into one band, but the chap who may have been able to answer that question was not available at that time.

I have s7 - s9 white noise on 20 almost all the time. I suppose that it is generated somewhere VERY locally. So I want to try to use noise canceling device. Does anybody have any experience with one of these?

As soon as my shack is full of computer noise, I will need a noise pickup antenna outdoors. I know that only MFJ has an external secondary antenna connector. But I am really concerned about poor MFJ quality.

Any experience appreciated.

Be warned - the radio's tx audio is a little weak. There is a known
problem with the mic placement as well as some of the audio circuits.
The new units shipping have apparently been fixed, but I would strongly
recommend getting on a repeater and asking for an audio quality report
before purchasing. It is a good radio if the audio has been fixed.

1965. Automatically search newsgroups - 218 1031041722 KFK

Newsgroup: rec.radio.amateur.equipment
Date: 1997-10-31 00:00:00 UTC
From: 476@477.com
Message-ID: <63ccgn$jda@news2.triton.net>
Source record: 162872

Automate your collecting research!

News Rover is the ideal tool for searching through Usenet newsgroups for messages about items that you collect. Once you tell it what to look for, News Rover will scan a set of newsgroups and collect all messages that contain what you are searching for. For example, if you are interested in messages related to slide rules or calculators, you could specify a search expression such as:

slide rule or calculator

News Rover will then scan a set of newsgroups you select and collect any messages that match the search expression. This searching is completely automatic, so it works while you sleep, work, or play. The search expressions can be as simple as a single word, or they can be complex expressions with AND, OR, NEAR, and NOT operators.

You can download a free demonstration copy of News Rover from:

http://www.NewsRover.com

But News Rover is good for more than just searching collectables newsgroups. You can use it to search for family names in genealogy newsgroups, or for any other type of information in any newsgroups you choose. And News Rover is ideal for picture newsgroups. It decodes both UUencoded and MIME base64 images, and it combines and reconstructs binary files that are split into multiple messages.

Here are some of the key features of News Rover:

o Scans newsgroups you specify while you sleep, work, and play.

o Automatically downloads messages and attached files so that they are available for instant access when you are ready to review them.

o Decodes attached files of all types (UUencoded and MIME base64).

o Displays a picture gallery of collected thumbnail size images.

o Selects messages based on include and/or exclude criteria to help you find a needle in a haystack and eliminate spam. You can even use complex selection expressions with AND, OR, NEAR and NOT.

o Supports multiple "interest groups," each with sets of newsgroups, selection expressions, message database, and picture gallery.

o Remembers files already extracted and eliminates duplicates automatically.

o Saves parts of multi-part files, searches for the missing parts, and rebuilds the entire file when the last part arrives. It even combines parts found on different days and in different newsgroups.

o Allows you to post Usenet messages and send e-mail messages.

o Allows you to block all future messages from specified senders.

o Operates on a schedule you set up to use your phone line only when you don't need it.

o Automatically dials the provider and hangs up the phone when it is finished.

o Works with almost all Internet providers and news servers.

o News Rover is multi-threaded so you can read messages and view pictures while it downloads and decodes more messages.

News Rover was designed and written by real-life Usnet newsgroup junkies! With News Rover the news is ready when you are!

To learn more and download your free demonstration copy, visit:

http://www.NewsRover.com

News Rover is getting rave reviews...

D.G. says: I downloaded News Rover last night... I ordered this morning. I don't know how much time I saved. I give your product two thumbs up!!!

T.B. says: "Great Job!!! I tried your software for the first time today, and it beats Plukit-32 hands down!!

A couple of weeks ago I bought a second hand TS520.

I bought this set becausse I am conviced that this is one of the best sets I ever worked with.

Now I discoverd that one of the switch contacts of the driver deck is bend away from the contact.

Does anyone knows if this is a modification or this is an error? The set tunes well on all bands but the reading of the plate knob does not fit with the pointer for 14, 21 and 28 MHz. The bended contact is for the 14 MHz section.

All you need do is change the 11.3258 Mhz Mixer crystal to a higher freq.
For every 0.150 Mhz increase in freq of this Crystal you will get a
450Khz increase in operating freq.

Today this unit uses a MB8719 PLL. This PLL is running in the middle of
its operating range. Even with this crystal at 11.3258 Mhz the upper limit
of the operating area is 28.235Mhz and as low as 26.335 in 10 Khz steps.
To do this you would need to provide an external method of changing the control
lines to the PLL chip. Since the channel selector switch does not allow a
direct control over the PLL divider lines you can provide extrenal control
lines for the PLL that will allow you to get a larger range. Other factors
will get involved as well. Like the Last Xmitter mixer, and the VCO range,
but if you can live with a 450 Khz spread in the 10 meter band then just get
a crystal in the 11.5 ~ 12.0 Mhz range and retune the Mixer coil.

John,

The MP is an excellent radio. Mine is about a month
old. There are some issues but probably no worse
than other radios. Check out the Yaesu reflector
for details.

I worked the recent WWW contest with the MP.
It has an outstanding ability to pick out signals
and filter QRM. One could argue that the DSP
is in the audio stage verus IF, but it still is a great
improvement over the non-DSP rigs. Don't buy
any radio without DSP built in.

The dual in-band receive is a feature that I like
and won't buy another radio without it.

Have fun choosing a radio.

Regards,

Paul, W2CW

I also spoke to them today, and they advised the same thing, there is also an upgrade price they offer if you have the cable from the last version used on an FT-50. They did confirm that there is a software switch that will allow you to change the bands to banks so you will be able to intermix frequencies in a bank/band.

I own both the Radio Shack HTX-202 and the ICOM IC-T2A 2M HTs.

The Radio Shack unit is a bit big and isn't very sexey, BUT I find the unit to
be a real "work horse" for me. I'm very happy with my HTX-202.

I'd be very happy with my ICOM IC-T2A, except for the fact that the way they
placed the mike in the unit, it sounds like I'm talking with a bucket over my head.

(There is a fix for this, but I've been too busy to get around to doing it.)

For now I just plug my Radio Shack externial speaker/mike into the ICOM and
the audio sounds great.

I think that maybe it's all for the best that I havn't open my unit and made the
change.
Those who purchased the ICOM IC-T2A should have ICOM correct the problem.
Maybe then, they'll get the hint and correct the future units as they're in
production.

Interesting, I had moved my Alinco Radio from my 85 Voyager to my
wife's 91 Grand Voyager when we went on vacation. All through the
trip, there was a VERY STRONG carrier on 146.52 MHz. While on
the trip, I thought it was my Alinco going bad on me. However after we
got back, I moved the radio back to my car and there was no problem.

My wife's car has the AM/FM/cassette player in it and my car has just
the basic AM/FM radio.

I'm glad you found the source of the noise, next year, I'll pull the fuse
from
the Voyager's radio when my wife isn't looking. <smile>

From: Bob <cqbdiaz@pacbell.net>
Message-ID: <345ABA6D.BB21E0@pacbell.net>
Source record: 162900

This is a question for those into ATV in the L.A. (Torrance) area:

I know that a lot of ATV contacts are being done via repeaters,
but do hams almost always make contacts that way OR do some
enjoy doing it via simplex, like on 426.25 MHz ?

By the way, I just got my "ham-cam" ATV transmitter running.
With an 80 mw output, it's not going to provide any real range,
but my sons (both hams) and I are having a ball playing around
with it.

There are at least two different feedline configurations being
provided with the commercial G5RV's. Some use a heavy duty twinlead
and others use ladder line. The physical arrangement of the
transition at the junction of the coax with the twinlead also varies.
Some use ferrite beads in a plastic tube and others use a simple
transition form balanced line to coax. There may even be some with a
1:1 Balun at that point. The only important variables across the range
of G5RV installations seems to be the length of the coax and the
included angle of the Vee.

If the coax at its far end, (i.e., at the junction with the balanced
line, is seeing 50 +j0 (which is rare), then the length of coax is
essentially immaterial. However, if the impedance is other than 50 +j0

with its consequent SWR, then the complex impedance seen at the transmitter end of the coax can be "all over the Smith Chart", as it were. One thing that "should" be constant for any reasonable length of coax at a single frequency is the SWR, although it will diminish slightly with longer lengths of lossy coax.

The only way that I can understand an SWR of 5:1 or more everywhere in every HF band is either a fault in the coax or the inverted vee configuration. If your dimensions are accurate, then the included angle is 112 degrees, which is fairly common. The only other possibilities are:
a) poorly installed connector
b) defective coax (struck by lightning?)
c) really bad physical unbalance (i.e, the coax doesn't come down symmetrical with respect to the two legs of the antenna)

Each of these possibilities can be resolved with some simple tests. Disconnect the coax at the point where it transitions to the balanced line and measure its characteristics with it shorted at the far end. With a 70 ft piece of coax, knowing the Velocity Factor, you should be able to measure the min. SWR frequency at the 1/4 wavelength frequency. The VF can be .66 or .8, depending on the type of RG-8 - I will assume .66. The formula is quarterwavelength (ft) = VF x 246 / f (MHz). Using this formula and 70 feet of shorted line, the frequency at which SWR should be minimum is 2.32 MHz (if I've done the numbers correctly). If that test doesn't check out within a reasonable tolerance, then your coax must be bad. If you are unable to disconnect the coax at the transition in order to make this test, then you will have to take the antenna down and disconnect the dipole legs from the balanced line and check the combined balanced line and coax together.

Continuing with the assumption that the balanced line is 31' of 300 ohm twinlead, then working around the Smith chart from a shorted line consisting of the balanced line plus the coax, you should see minimum SWR at 2.65 MHz, if the line is not defective.

While we're on that subject, W6RCA's Basic program for doing feedline calculations shows that a G5RV should have a somewhat shorter length of balanced line (when on 80M) than the 31 feet normally used. I hope I'm doing something wrong here, but the calculations suggest that 20 to 27 feet would be a better length for 80 M. Unfortunately, it wants to be more like 33' for 40 M, etc. As you can see, the G5RV design is not perfect - it's a compromise for all execpt 20 M. That's where it's supposed to present the better match. Since you do not get a good match anywhere within the 20 M band, there must be something defective in your line (I am discounting the possibility that you have something large and metallic very near to the dipole itself, or that there is a defective insulator at the end of the antenna, or that you have done something dumb, such as using a metallic support wire instead of rope at the ends of the antenna, or that there is another wire antenna parallel to and within 1/4 wavelength of the G5RV..

Simple inspection of the way the feedline comes down will determine whether or not it is symmetric with respect to the dipole halves. An angle of less than 60 degrees with either leg would be cause for concern.

The bottom line is that G5RV is NOT a bad antenna - but yours may have a problem.

I was a design engineer at CODAN and we were using rotary encoders for
the new radio we found that it was a software problem in the way we were
decoding the rotary encoders and had to write some pretty nifty code to
get around the short commings of the knobs. I figured it was a majour
marketing problem to not be able to count the clicks not to mention very
annoying. I think not enough people have complained to Yaesu!

I have a TS50 HF rig with antenna tuner. It will tune up for receive when changing bands , but locks up and will not drop so that I can run autotune for transmit. It started doing this about 3 months ago. And origionally if you tapped the side of the antenna tuner would unlock. Any help would be appreciated.

Bill, I have two of the tuners, and my buddy has two also. Try
the Kenwood reset- turn radio OFF with the button on top left of TS-50. Press
and hold BOTH of the BAND buttons (lower RH corner of AT-50) while you turn
the radio ON. Hold both of the
BAND buttons in until the radio and tuner stabilize, perhaps 10
seconds. The tuner should now be OK. I have found two cases where this didn't
fix the problem, both were dirty contact on the potentiometer driven by the
motorized variable caps in the tuner.
A shot of tuner-cleaner cured it for me.
Hope this helps, 73, George, K1RBS

Hi Meade,

My FT-50R does the same thing. Not enough to really bother me but it has
been a nuisance on occasion. I like the radio too but I find that the PTT
switch sometimes doesn't make as good a contact as I think it should.
Oh well, maybe I'm just picky. Overall Its been a great radio.

How much power do a pair of 4CX800s in an Alpha 91b produce when
running "full output unlimited"? Is this what it takes to achieve
"Honor" Roll :-)

Hello Jeff,

Do you really think it's relevant to be waving a pair of 4CX800s in people's faces when you're still talking 3db advantage - unless, of course, you're cheating?

I maintain that the differences in propagation paths, antennas and operator skills will more often than not make up for a 3 db power disadvantage. Of course, if EVERYTHING ELSE were truly on an even footing, then I would agree that your extra 3db could make the difference, and that's what Bill is saying - put your money where your priorities are!

I still have for sale a Kenwood TH-22AT 2m HT with the following:

* new NiCad battery pack

* alkaline battery pack

* speaker mike

* wall charger

* rubber duck, original box and manual

The rig is menu driven, has 40 memory channels, one call channel, CTCSS,
DTSS, a full DTMF keypad, multi scan modes, three transmit power settings
for battery conservation, and a lot more.

Everything is working fine. I need to sell this package to upgrade.

$225 shipped obo over $200
